The feed water of boilers acquires a galvanic effect in passing through the tubes of surface condensers.

ONE THOUSAND feet of ordinary illuminating gas can be readily compressed into a space of ten feet.

A NEW MODE OF INTENSIFYING LIGHT is said to have been devised by Messrs. Motay & Masechal, which resulted from a discovery by one of their assistants. It has recently been tested in Paris, and proved very successful. The light produced is said to be intense. A small cylinder of magnesium, placed in the center of a gas jet in combustion, becomes luminous, and produces sixty times as much light as ordinary gas. We infer that the magnesium is protected from being consumed in consequence of the absence of oxygen, from the center of the jet, and that a large portion of the waste heat of the jet is thereby converted into light. If the statement is correct, such a light must be of great utility for lighting streets, public buildings, etc.

PICRIC ACID.—In a lecture delivered before the Society for the Encouragement of National Industry in France, Dr. Calvert, F. R. S., spoke of a curious application which has been made of the explosive property of the salts of this acid. During the last few years, the picrate of potassium has been employed in great quantities by Mr. J. Whitworth, for charging the bombs for destroying the iron plating of ships. When the projectiles thus prepared strike the iron masses, the enormous force with which they are expelled from the gun is instantaneously converted into heat, and to such an extent that the ball becomes red hot, the heat decomposes the picrate of potash, and a violent explosion ensues, owing to the enormous quantities of vapors and gases which are thus produced in an instant of time.

SPECTRA OF FLAME.—Prof. A. Lielegg has continued his researches on the spectra of the flame in which the melting is carried on according to the Bessemer system. This flame being only carbonic acid gas in an incandescent state, and the spectrum of this gas being yet unknown, the observations of M. Lielegg have served to fill up a gap in the series of spectra produced by the gases in combustion. The apparition and disappearance of some of the luminous fixed lines is closely connected with the metallurgical operations. At the moment when the decarburization of the iron is nearly terminated, these spectral lines assume essential modifications. The appearance of a group of lines and of an isolated line in the violet blue portion of the spectrum, marks a singular moment of the period during which the soft iron is being formed, and these lines disappear sooner than all the others; their appearance and disappearance serve, therefore, to indicate the termination of the process.

SELF-REGISTERING BAROMETER.—M. Brequet, the well known clock and scientific instrument maker, has exhibited at the Champ de Mars, Paris, a new self-registering barometer, called the "Barometrograph," giving indications every six hours, by diagram, of the pressure of the atmosphere. It consists of four metallic boxes, the upper and lower of which are undulated, (the usual aneroid barometer;) a vacuum is made in each of these boxes separately, and they are attached to a chain, the movement of which is four times greater than that of a single box for the same variation of pressure. A steel spring acts upon these boxes in a contrary direction to the atmospheric pressure, and communicates with an indicating lever. The registration is effected on a cylinder which revolves by means of an ordinary clock; it makes a complete revolution in a week, and carries a glazed paper, which is covered with lamp-black by being held over the flame of a candle; the extremity of this lever, very fine and pointed, traces a line of variations in a white streak. The periods (four times a day) are represented on the diagram by vertical lines, and the barometric readings by horizontal lines placed a millimeter apart, the arm of the indicator being so arranged as to mark the variations on the same scale as a common mercurial barometer. This instrument has none of the errors of the common aneroid barometer resulting from the great number of pieces, levers, articulations, gearing, connecting chains, and springs.

Dr. Crossley, of Lowell, Mass., is manufacturing coffins of slate, instead of wood. They may be sealed air-tight.

Contributed for Our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

207.—Mr. J. W. Knox, of the Golden State Foundry, has placed upon our table a fine specimen of sulphureted ore, from the Mountain, or as it is sometimes called, the Belding mine, located about six miles southwest from Volcano. Mr. K. informs us that that portion of the vein from which it was taken, averages from 30 to 40 per cent. of sulphurets, which assay about \$400 per ton, after the free gold has been taken out by the ordinary process of amalgamation. The specimen before us shows a large amount of free gold. The mine was worked some three years by an arrastra; but a 5-stamp mill was erected upon it some two years ago. It is now opened to a depth of 175 feet from the surface, and is worked altogether through shafts. It has already yielded fully \$100,000. The company have been sinking during the present winter, and have recently struck a body of quartz, said to be larger and richer than any ever before found in the mine. It is said to pay as high as \$150 per ton in free gold.

208.—Mr. Joseph Bennett has contributed to our cabinet a specimen of gold and silver ore from Durango, Mexico. The specimen consists in a large part of decomposed quartz, carrying, as we are informed, about twenty ounces per ton of gold and \$900 per ton of silver, mostly as a chloride. Of course, no very large quantity of ore of this description can be found. The mine has been worked a long time by Mexicans with arrastras, the amalgamation being effected in large iron kettles.

BELLINGHAM BAY COAL MINES AGAIN ON FIRE.—The *Olympia* (W. T.) *Transcript* of January 25th, has the following: Captain Roeder informs us that the Bellingham Bay coal mines are on fire again. It will be remembered that they were on fire last summer, and had to be flooded by cutting a channel and letting in water from the Sound. Pumping the water out was only finished about the 1st of January. Extensive preparations had been made to prosecute operations the coming summer, in the building of shutes, putting up of engines, and other improvements, so that the company would be able to take out 400 tons of coal per day. The fire is in the lower works, and it is probable they will have to be flooded to put them out.

HENDY'S CONCENTRATORS.—We noted a short time since that the North Star Company had placed in their mill at French Lead a number of these concentrators and refrained from expressing an opinion as to their merits until a satisfactory test had been made by experience in working them. In another column will be seen a certificate from W. H. Rodda, Esq., the Superintendent of the North Star Co's mine, bearing ample testimony to the merits of these concentrators as a most valuable addition to quartz mill operations in sulphureted saving. The company have eight of these concentrators in operation; and the result is the saving of 95 per cent. of the sulphurets in the rock crushed, thus establishing their value beyond peradventure. We understand that Capt. Lee, Superintendent of the Empire Co's mine at Ophir Hill, has six of these concentrators in operation at the Empire mill, and with the use of these, other kinds of pans formerly in use, can be entirely dispensed with. The invention of Mr. Hendy will commend itself to all operators in quartz mines who may visit and inspect the working of those now in use in our quartz mills.—*Grass Valley National*.

SAFETY OF DR. LIVINGSTONE.—Sir R. Murchison publishes in the *London Times* of Jan. 20th, a telegram just received from the commander of the boat expedition, to the effect that Dr. L. had gone on into the interior in safety. The white man, of whom we have heard as seen on the west side of Lake Tanganyika, must therefore have been the Doctor.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

73,323.—CORN-SHELLER.—Jno. R. Hamilton, Portland, Oregon:

I claim, 1. The apparatus, as constructed, with a series of rowsers *aaa*, arranged in a circle, also the scrapers *fff* in the rear of the rowsers, substantially as and for the purpose set forth.

2. Also, the rowsers, as arranged alternately, the one forward of another, the same being pressed by springs towards the center, so as to act as a wedge, parallel with, between, and under the rows of corn.

3. Also, the sliding plunger *H*, to push ears between and through bars *aaa*, with the rowsers or points *b b* attached either vertically or horizontally, as and for the purposes herein set forth.

73,324.—LAMP-CHIMNEY CLEANER.—Jonathan R. Hamilton, Portland, Oregon:

I claim, 1. The scrubbers or wipers *A A'* and *C C'*, when constructed and applied so as to operate substantially in the manner as and for the purposes herein set forth.

2. Also, the wiper, as constructed, in combination with the gear-mechanism for operating the same, as specified.

73,348.—THRESHING MACHINE AND GRAIN SEPARATOR.—Levi B. Lathrop, San José, Cal.:

I claim, 1. The device for imparting the peculiar motion, as herein described, to the screen *E*, said device consisting of the inclined guides *C*, arm *G*, and crank-shaft *H*, or their respective equivalents.

1. Providing a screen, *E*, with alternate depressions and elevations similar to waves, substantially as and for the purposes herein shown and described.

3. The packing *e*, when arranged at the sides of the frame of the screen, substantially as and for the purposes herein shown and described.

4. Passing the grain by any suitable conveyor directly under the end of a suction pipe, as set forth.

5. The screen *E*, when arranged and operated as set forth, in combination with the suction tube *I*, the same being arranged substantially as described.

6. The tossing motion of the screen *E*, when applied to the purpose of separating grain from straw, or for separating it from chaff, or for simply conveying light articles, substantially as described.

73,366.—STAMP MILL.—Geo. R. Mitchell, Nevada, Cal.:

I claim, 1. The bearing *D*, having the lower portion enlarged, forming a water chamber, *a*, substantially as described.

2. In combination with the above, and with the stem *B* of stamp *A*, the water-supply pipe *H*, tube *F*, stop-cock *G*, and flexible hose *E*, substantially as described and for the purpose specified.

73,497.—SPRING ATTACHMENT FOR VEHICLES.—Eliphalet C. Brooks, San Francisco, Cal.:

I claim the combination of the shield *A*, bolts *F* and *G*, with the perch *D*, axle *E*, in combination with the spring *C* and thorough-brace *B*, substantially as shown for the purposes specified.

73,519.—MACHINE FOR COLLECTING AND CONDENSING METALLIC VAPOR.—Ferdinand Formhals, San Francisco, Cal.:

I claim, 1. The construction of the cagniardelle-blower principally of wood.

2. Also, the combination of the cagniardelle with the furnace, in combination with tanks, substantially as set forth and shown, and for the purposes specified.

73,555.—TAMPING AND BLASTING MACHINE FOR SPLITTING WOOD.—Elisha W. Walton, Drytown, assignor to Joseph H. Atkinson, San Francisco, Cal.:

I claim, 1. The construction of the barrel with a charge cavity and screw, with cross-head, handles, nipple, and hammer, substantially as described, and for the purposes set forth.

2. Also, the screw cleaner, for the purposes set forth.

73,556.—CHURN.—Samuel J. Whipple, Oroville, Cal., assignor to himself and Jos. H. Atkinson.

I claim a metallic or wooden churn, in which all the parts described and represented are arranged in the manner set forth.

73,682.—HYDROCARBON BURNER.—James H. White, San Francisco, Cal.:

I claim, 1. The combined use of the products of decomposed steam and wet or ordinary steam, each being introduced separately, and in such proportions as may be required, into a gas holder or mixer, for

the more perfect combustion of the vapor of hydrocarbon oils, substantially as described.

2. The superheating and decomposing apparatus, consisting of the cylinders *J J'* and *I*, and the gas or supply tube within the mixer or holder *D*, substantially as described.

3. The horizontal cylinders or mixers *D D*, having openings or hurners entirely around their circumference, on the under side as well as the others, which causes them to be more effectually heated, and also prevents their filling or being clogged by a residuum.

4. The combination and arrangement of the interior perforated tubes or pipes *F, g*, and *d*, with the exterior cylinder or mixers *D D*, substantially in the manner and for the purposes set forth.

5. In combination with the above claimed apparatus, the perforated air-tube *L*, for supplying hot air to render the combustion of the vapor and gases issuing from the mixers more perfect.

The object of this invention is to provide an improved apparatus for burning the gas of steam and petroleum as fuel, and more especially when used under steam boilers; and it consists in first introducing the petroleum to a horizontal heated cylinder, by means of a small pipe extending longitudinally through the cylinder, and having three or more perforations on the top, through which the oil is allowed to pass. When it leaves the pipe it is instantly vaporized, and fills the cylinder with hydrocarbon vapor. As this vapor contains an excess of carbon, it will not fully consume, but will burn with much smoke and deposit soot. The inventor therefore passes a small quantity of steam from the boiler, first through a superheater, and thence through a cylinder filled with coke in small fragments, where it is decomposed, and hydrogen and carbonic oxide are formed. These two gases are allowed to pass into the first mentioned cylinder by means of a perforated pipe, and are there intimately mixed with the hydrocarbon vapor. A jet of wet or ordinary steam is then introduced to the cylinder, where the excess of carbon decomposes it, from its well known avidity for oxygen when at a high temperature, taking one proportion of oxygen and forming carbonic oxide, and leaving the hydrogen free. These gases thus produced, together with the hydrocarbon vapor, then pass from the cylinder through jet-tubes or burners, situated at a small distance from each other, and all over the cylinder, where they meet with the oxygen of the air, and are burned with an intense heat. An additional supply of oxygen is furnished for more complete combustion, by a perforated tube connecting with the open air, or with a blower, and opening into the fire-chamber behind the bridge-wall.

It is claimed by the inventor that the results of this combustion are very much greater than those obtained by any other method of burning petroleum, and by experiment have proven that the amount of heat-producing fuel furnished by the steam is nearly equal to that produced from the oil, it being in fact a water-gas. The oil used in the apparatus is either crude petroleum as it is gathered from the wells, and the foreign matter allowed to settle, or as it is provided by distilling the petroleum, or shales which contain it, and which are found in great abundance on the California coast. This distilled oil should not be below twenty degrees nor above thirty-five, Baumé's hydrometer, with the thermometer at 60° Fah.

RECENT INVENTIONS.

NEW GRAVITY PADDLE WHEEL.—Mr. Wm. Sublett, of this city, has applied for letters patent through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, for an improved gravity paddle wheel, the object of which is to provide a wheel, in which the lift or "dead water," as it is called, may be avoided as the boat leaves the water; while at the same time there are few joints or bearings to be corroded, and no complicated mechanism involved—the floats turning automatically. These floats are pivoted at each end in the rim of the wheel, the pivots being situated in the center of the float, but about one-third of the whole width from its upper edge, and strengthened by suitable bearings inserted in the face of the wheel, which are believed by the inventor to be equal to the power demanded of them. In

the forward motion, the paddle strikes the water as any ordinary float, and with the same power, until it reaches the point of greatest depth, or directly under the axle of the wheel, when it turns by the force of gravity, so as to present only its edge as a resistance to the water during its return to the surface, at the same time throwing off all dead water as it emerges, to again assume its proper position by means of the same beautiful law.

In the backward motion of this wheel the blades strike edgewise, avoiding the jar or lift of the stationary floats, while the blades, turning at about the depth of the paddles, become locked, and act precisely as in the common wheel, but with more propulsive power, as is claimed, to the extent of from ten to fifteen per cent. in consequence of avoiding the jar and lift, by means of the feathering action as described.

From a personal examination of a working model, at Mr. Hammond's jewelry store, No. 57 Second street, where a three-foot wheel is at work, and where the same was made, we should judge that its backward motion, for reasons already assigned, would require from 30 to 50 per cent. more power than the forward movement.

As to the power of this wheel over others, the inventor is sanguine that while running at a depth of only a few inches, it will be equal in propulsive power to that of any wheel in use; that it will gain in power as it is submerged, until it sinks beneath the center of the wheel in consequence of bringing to bear a greater number of paddles to accomplish its work, unaccompanied by the dead water lift by which other wheels are encumbered, when similarly submerged.

We understand that arrangements are soon to be made to put this wheel to a practical test, by which the question as to its availability and advantages over those in ordinary use will be fully, and as we hope, satisfactorily settled. We understand that the model above described, has been examined by a number of shipwrights, who have expressed much confidence in the invention. Mr. S. is also preparing to make a trial in a short time of his propeller, another invention, to which allusion was made not long since in our columns.

NORTH BLOOMFIELD GRAVEL COMPANY.—The North Bloomfield Gravel Mining Co. has increased its capital stock from \$400,000 in 80 shares of \$5,000 each, to \$800,000 in 8,000 of \$100 each. Among the holders of the 80 shares, we notice the names of W. C. Ralston, S. F. Butterworth, and A. Pioche, of this city. The property of the company consists of ditch and gravel claims, located in Nevada county.

THE PESTILENCE IN BUENOS AYRES.—A letter of date January 13th, says that five thousand persons had been carried off by cholera in forty days. The churches are taken for hospitals. There are not carts enough to carry away the dead, nor men enough to dig their graves.

DEATH OF A WEALTHY IRON MASTER.—Mr. Crawshaw, the wealthiest iron master in England, has recently deceased. His estate, which was at first thought to be worth about \$20,000,000, has finally turned out to be fully \$35,000,000.

THE telegraph informs us that the corner stone of the great bridge across the Mississippi at St. Louis, was laid on Wednesday last, with appropriate ceremonies.

GAS IN STOCKTON.—Capt. Kidd, of Nevada, the original owner of the steamer Washoe, has entered into a contract with the authorities of Stockton, to furnish that city with gas works.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

EMPIRE G. & S. M. Co.—Feb. 25th.—Meadow Lake, Cal. Capital stock, \$100,000; 2,000 shares, \$50 each. Trustees: R. W. Neagle, W. R. Morris and L. B. Hines.

CONSTOCK M. Co.—Feb. 24th.—Gold Hill, Nevada. Capital stock, \$1,250,000; 2,500 shares, \$500 each. Trustees: J. J. Holmes, John Lannie, A. J. Finley, Benj. E. Harris and Tohn R. Brett.

CONTINENTAL Life Insurance Company 302 Montgomery street, corner of Pine.

Weekly Stock Circular.

Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,
FEBRUARY 23, 1888.

Financial.

Our money market is in a most plethoric condition, but rates remain unchanged. A financial curiosity exists in this city, which we allude to simply because it is a problem we have been unable to solve. Some banking houses, or acting in that capacity, pay their depositors 1 per cent. per month, while the heavy concerns are only too glad to loan at 10 per cent. per annum. Our State Treasury contains, at the present writing, one million one hundred and fifty-nine thousand six hundred and fifty-seven dollars in coin—not paper promises—while our City Treasury is in a like healthy condition. It seems a pity that some way cannot be devised by which these large sums may be made to draw interest, without coming into direct competition with private enterprise or capital.

The gold deposits in the San Francisco Branch Mint to the 31st January, inclusive, were 9,143 ounces gold, and 22,420 ounces silver, while the coinage for the same period amounted to \$80,000 gold, and \$17,000 silver. The Mint reopened on the 18th January, consequently the above returns are for less than one-half the month. Our roads have been for weeks in an almost impassable condition, communication with the interior and mining regions being difficult, and frequently impossible. For this reason the Virginia office of Wells, Fargo & Co. has ceased to receive bullion, not being able to send it forward.

Gold bars are scarce and in demand, selling at 910. The silver bullion market is in an excited condition, owing to unusual competition among capitalists for its possession. Silver bars are very scarce, and ranging all the way from 1/4 to 1 1/2, and even as high as 1 1/2 per cent. premium, with a strong upward tendency. We quote Currency Bills on Atlantic cities at 96 3/4 per cent. premium on gold; Sight Drafts, payable in coin, at 1/4 per cent. premium; Telegraphic Transfers, 1 per cent.; Sterling Exchange, 45 1/4, and Commercial Exchange, 49 1/4 @ 49 1/2.

Real estate transactions are continued with unabated vigor, amounting almost to a fever. In many instances lands have been purchased for much more than their real value, or what they are likely to be actually worth for several years to come. The experiences of the past should not be lost sight of at this time. In 1855 real estate values had been inflated to almost fabulous figures, and this species of property was received by the banks as collateral security at rates entirely disproportionate to its actual value. When the financial crash came, the banks failed to realize on those collaterals, and real estate fell to a nominal value, causing ruin to thousands, and dragging down with it all confidence in its future. The inauguration of the Pacific Railroad enterprise, the rapid progress made in its construction, the building of other railroads in the State, the immense supplies of wheat and other farm products shipped from this port during the past two years, and other causes tending to the enlargement and commercial prosperity of this city, have had the effect of restoring confidence in real estate; but there is danger that it will be carried to a ruinous extent. Large masses of capital which could have been as profitably invested in other legitimate business, the establishment of which would have resulted in greater public and private benefit, have been directed to the purchase of this species of property. While it affords a source for sincere gratification to witness so general a conviction of the future greatness of this city, it would be quite as well to use a little prudence, and not apply the hot-house forcing process.

The shipments of Treasure from February 1st to date have been as follows:

February 8—Per Idaho to Honolulu	\$25,000 00
February 10—Per Montana—	
To New York	\$1,038,781 30
To Panama	20,000 00
February 12—Per Golden City—	
To New York	\$476,147 47
To England	2,616 74
To France	2,652 07
To Panama	20,000 00
February 19—Per John Wooster to Hongkong	501,416 28
	59,707 81
Total since February 1st, 1888	\$1,644,963 39
Previously this year	4,823,963 27
Total since January 1st, 1888	\$5,470,868 66
Corresponding period 1887	7,267,340 24

Decrease this year, \$1,796,471 58

The duties paid at the Custom House in this city since Feb. 15th, and previously this year, have been as follows:

February 11	\$9,079 26
February 12	34,129 74
February 13	37,271 90
February 14	15,303 87
February 15	24,066 72
February 16	23,215 01
February 17	16,298 97
February 18	29,389 39
February 19	5,036 03
Previously in February	935,515 65

In February to date, \$832,236 54
In January, 893,238 05

Total since January 1st, 1888, \$1,225,474 90

City Stocks.

The market has been almost devoid of transactions in other than mining stocks during the period under review. We observe that Gas stock is in demand, private sales having been made at \$57 50, including the usual 1/2 per cent. dividend payable next Monday. Transactions in Water Co. stock were made at \$50, with a downward tendency, owing to the probability that the capital stock of this company will be increased \$2,000,000 at the meeting of stockholders to be held on the 17th inst. City Bonds have been in the market at \$90 @ 91. California Steam Navigation Company stock is sought for at 73 1/4 per cent. Insurance stocks are dull, and few transfers have been made within a week or two. At the close, twenty shares of Sutter Street Railroad (old stock) sold at \$11 50.

The receipts of the local insurance companies during the month of January, 1888, according to the returns made to the Internal Revenue Department, have been as follows:

Pacific	\$85,439
Union	30,223
National	34,044
Fireman's Fund	18,653
Builders	17,358
California	11,136
Merchants' Mutual Marine	11,331
Occidental	5,289
Home Mutual	8,396
San Francisco	4,921
Peoples	8,769
Total	\$213,171

The returns were made upon a legal tender basis, the rate—72 cents for January—being fixed every month by the Assessor of the district.

The above statement shows a very considerable gain over the receipts in December, the aggregate increase amounting to \$36,743. The receipts of the several companies in

January, as compared with December, show the following difference:

	Increase.	Decrease.
Pacific	\$8,231	
Union	5,384	
National	5,509	
Fireman's Fund	3,106	
Builders	1,546	\$1,160
California	5,059	
Merchants' Mutual Marine	1,111	
Occidental	1,892	
Home Mutual	552	

The receipts of the city railroads for the month of January, 1888, have been as follows:

Omnibus	\$21,693
North Beach & Mission	19,545
Central	11,520
Front Street, Mission & Ocean	7,986
Market Street	5,949
Potrero and Bay View	986
Total	\$67,069

In December the total receipts amounted to \$70,251, showing a decrease of \$3,182 in the month of January.

Mining Share Market.

The condition of the mining share market is still active. A slight decline manifested itself early in the week, which, however, was but momentary, and stocks at present continue at a high figure. The recent rapid advance came rather unexpectedly, and may be mainly attributable to the activity of Hale & Norcross a few weeks since. Insiders looked for a sharp advance early in the spring, but the eagerness of purchasers with unemployed capital developed itself so rapidly that outsiders now command the situation. The sales at present are larger than ever before, and a still greater increase may be looked for, since profits upon ventures have been unusually large. The operators in the immediate vicinity of the Exchange have received large accessions to their numbers, and at high noon California street emulates the activity and excitement of Wall street.

The open sessions of the Board will hereafter be held from 10 to 10 1/2 o'clock, A. M.

SAVOYO—received from \$200 to \$174, and closed at \$178. We note a lessened product for the week ending February 22, 1,307 tons of ore being the yield, valued at \$49,026, or \$30 62 per ton. Of this amount the north mine, on the third stratum, produced 650 tons, and the south mine, same level, 422 tons. The north drift on the fourth stratum is again barren, and at present only the most promising streaks are followed. The south mine, on the same level is reported to look as well as ever, the drift having been advanced some twenty-five feet south, and the face showing excellent ore. On the fifth stratum, 215 feet northwest from the shaft, a body of ore and quartz has been unexpectedly developed, comprising some four feet of fair ore and five feet of quartz rock. These are promising indications for the future of the mine.

IMPERIAL—declined from \$270 to \$229, advanced to \$265, and closed at \$247 50. This mine shows no material change since our last issue. About seventy-five tons of ore continue to be daily taken from the Alta mine, and from the Holmes mine some ten tons per day are at present extracted; the latter will be increased shortly. It is now reported that they will be ready to drift from the new shaft early next week. The shaft and machinery are in perfect order. Receipts of bullion during the current month, \$37,036.

CROWN POINT—sold to a small extent, dropping from \$1,900 to \$1,655, rising to \$1,840, then selling at \$1,775, and at the close \$1,800 bid. At present no ore is taken from this mine. A large force of hands was employed in retimbering the shaft, which was finished on the 24th inst. It is reported that the prospects are very fair on the 880 level. Receipts of bullion during the current month, \$23,500.

KENTUCK—has been quite active, declining from \$300 to \$265, advancing to \$292 50, and closing yesterday at \$282 50. The receipts of bullion for February account are stated at \$5,017; it may however be remarked, that the run for the present month commenced on the 15th inst.

HALE & NORCROSS—We are informed that the connection between the 330 and 750 levels has been made. The upper floors of the lower level continue to look well.

OVERMAN—was largely dealt in, dropping from \$240 to \$190, rallying to \$230, then selling at \$210, and closing at \$200. This company is now extracting ore quite freely. At latest advices they had four mills at work, which were reducing about 100 tons of ore per day. So soon as they commence extracting ore from the 361 level additional mills will be employed. A small amount of bullion is now ready for shipment, but the bad condition of the roads prevents its transportation. By later advices we learn that in drifting north towards the Segregated Belcher ground, on the 500 level, at a point 82 feet from the shaft, some fine ore has been developed.

CHOLLAR-POHOS—has been tolerably active, selling within a range of \$200 @ 215, and closing at \$205. During the week ending February 20th, but 78 tons of ore were extracted, the entire amount coming from the Blue Wing stratum; 520 tons were sent to custom mills during the same period. No encouraging developments have been made during the week under review. The shaft is now 925 feet in depth, and the drift at the 332 level is running in barren quartz. On the 24th inst., 33 1/2 tons of ore were shipped to custom mills.

AMADOR—advanced from \$230 to \$300. This mine continues to look well. The yield of bullion in February, it is confidently believed, will reach nearly \$50,000. The next monthly dividend will probably be larger.

YELLOW JACKET—opened at \$1,225, declined to \$1,220, rallied to \$1,300, and closed at \$1,280. It is expected that another assessment will soon be levied. GOLD & CURRY declined from \$100 to \$550, advanced to \$615, and at the close sold at \$625. ALPHA received from \$1,570 to \$1,475. BELCHER from \$280 to \$285, closing at \$300. OVERMAN from \$175 to \$154, and at the close sold at \$164.

Both EXCHEQUER and SEGREGATED BELCHER were disposed of to a large extent, the former selling at \$44 @ 33, and closing at \$40; and the latter at \$20 @ 19, closing at \$20.

LADY BRYAN—has been in the market at \$25 @ 37 50, closing yesterday at \$30. By a telegraphic dispatch we learn that \$1,500 in bullion will be forwarded to this city on the first proximo. The mine is reported to look better than the others. ALPHA sold at \$224 @ 30, and GOLD HILL QUARTZ at \$97 @ 90 1/2.

The sales in the Board during the past week have been as follows: Regular sessions, \$1,863,747; open sessions, \$324,310—total, \$2,188,057.

GOVERNMENT RAILROADS.—Hon. Josiah Quincy is still urging his favorite plan that

the State governments should own and operate all railroads within their respective territories. He is anxious that the experiment should be immediately tried on the Great Western road from Boston to Albany.

MANY of the English railroads now send out pilot engines in advance of the trains, in consequence of anticipated mischief from the Fenians.

MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.)

Comprising the Names of Companies, District or County of Location, Amount and Date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Miner, Feb. 15th: The Pennsylvania company continues to encounter small veins of quartz, bearing fine ruby silver ore. They think they have about seventy feet more to make to cut the main lode.

The Pittsburg has struck a lode in the main tunnel. They are three feet into quartz which shows silver.

The Lateral tunnel of the Monitor Consolidated Co. has in a little less than three weeks time gone in on the ledge over forty feet.

The successful bidder for the contract of the Imperial Co., Mr. Wm. Mercer, of Silver Mountain, commences on Monday with a force of six men and is to run the tunnel without delay.

Amador County.

Ledger, Feb. 22d: The present fair weather is stimulating operators in quartz to renewed and usually successful exertions. From all parts we hear good news. Sixteen miles east of Jackson, at the Mountain mine, or Belding, as it is sometimes called, Benjamin & Co., who have been sinking the present winter, struck a body of quartz said to be larger and richer than any ever before found in the mine, paying over \$150 per ton.

The Pioneer now under lease by Sorocco Bros. and McLane, is in full blast, and we hear they have contracted for the delivery of two hundred tons of the ore at Thoss' sulphuret mills on Elsie creek. The Italian, also owned by the above named Co., made a fine strike in the south drift the present week. The Union, too, we hear, will continue its developments, and the ore sent to Mr. Griffin of the Sutter Creek mill.

To speak of such mines as the Coney, the Kennedy, the Oneida, the Eureka, the Mahoney, the Keystone etc., where tens of thousands are turned out weekly, would be superfluous.

Calaveras County.

Chronicle, Feb. 22d: The famous "Petticoat" lead, located at Railroad Flat, has been sold recently, for the sum of ten thousand dollars. We understand that a gentleman by the name of Said was the purchaser. The rock from the claim before reaching the water level, paid remarkably well. As nothing further could be done without machinery, and the locators had not the means of procuring it, they concluded to sell. The company will undoubtedly erect a mill in the spring.

Mariposa County.

Gazette, Feb. 22d: We learn that Mr. Brummagin, the present manager of the Mariposa Estate, will commence operations immediately on the Pine Tree and Josephine mines. Mr. Brummagin, is now fully aware of the folly of building mills, and high dams; and it is his intention to construct a ditch from a point on the Merced river, formerly known as the "Old Broadhead Dam," where there is a natural dam with a fall of twenty-four feet, and immediately below a succession of falls, which places the ditch above all high water marks. A ditch constructed from that point, as we learn, would be about six miles in length, with a twelve or fourteen foot grade to the mile, and would bring the water from eighty to one hundred feet above the river at the Benton mills, thereby giving the Co. ample space to set their mills and machinery above the reach of the highest freshets.

The mining company at the lower end of town struck very good ground on Thursday, when they cleaned up twenty-five dollars. There are four men in the company.

Mail, Feb. 22d: The Bear Valley mill was started on the 13th inst., on Josephine ore. It runs 12 stamps in dry batteries, whence the pulverized ore passes through screens into revolving drums containing iron balls; thence into the Ryerson amalgamator, from which it is discharged upon the shaking table. The capacity of the mill is ten tons per 24 hours. The yield of the ore now under treatment is from \$25 to \$50 per ton, with great regularity. The Pine Tree mine, is in good condition.

On the Oakes & Reese mine, the main shaft is now 200 feet in depth. The mill works 15 tons per day, or 300 tons to the run of 20 days. The average yield is \$30 per ton. All the workings are now yielding superior ores; while at one point, a small lateral vein is yielding rock of astonishing richness. The entire works have been erected within a year, at a cost, above receipts, of about \$75,000. The mill commenced operations about the 15th of No-

vember, and has run steadily since. It is one of the most complete and best managed in the State.

The Carson mill and mine are lying idle—the mine filled with water.

Barrett, Pillon & Machin, whose mine is on the Blue lead, about one mile and a half southward from the Oakes & Reese, struck a very rich pocket some time in December, and since the 20th of that month have taken out about \$40,000, and are still extracting extremely rich ore.

La Victoire Copper Mine, which a few years since promised to become the second copper mine in the State, has been entirely abandoned.

Sonora Herald, Feb. 22d: We learn that the result of the last week's work on the Ferguson mine with an 8-stamp mill was 174 ounces of gold. Coleman and Doherty are making big licks on Ned's Gulch. Their rock pays about \$150 per ton. Parties from San Francisco have purchased the Rutherford Mine, on the Merced above Ferguson's, and are going to build upon it. At Hite's Cove, the old mill being washed away, work is suspended on the mine; but in the course of a month Hite & Co. will commence building a 20-stamp mill. Andrew Rocca's mine near the Bower Cave, Peter Winian's, Eclipse mine, on the North Fork, and H. G. Coward's, on Gentry's Gulch, are all being actively worked and are paying well.

Nevada County.

Transcript, Feb. 20th: Negotiations are pending for a heavy sale of mining ground and water rights in Little York township. The Williams' ditch, Brown & Bros. mining claims, and other ground, is mentioned as being included. San Francisco and English capitalists are said to be interested. The price mentioned is in the neighborhood of \$150,000.

The North Star mine is now yielding handsomely. Six pumps are kept running. The incline is now down 900 ft., the lead is being worked from several levels, and it is proposed to sink 100 ft. more for another. Recently a new 30-horse engine has been put up to do the hoisting from the incline, and the 15-horse engine formerly used for this purpose is being put up over a new shaft, which is already 90 ft. below the surface. The mill is run by two 60-horse engines. Sixteen heavy stamps are kept going constantly. Several of Hendy's concentrators have been put up in the mill. The sulphurets saved by them are very clean.

The parties working the Wisconsin mine by contract are now engaged in putting in a "plunger," and adding to the strength of the machinery. This mine is located between Grass Valley and Allisou Ranch.

The town of Forest Springs is not so lively as last year, but the mill is kept running, and considerable prospecting is being done upon the hills around.

21st: At Red Dog, several companies are at work, some drifting and others preparing their claims for active operations. Seven companies are almost ready to start up.

At You Bet, the cement claims seem to be doing well, but several have shut down in consequence of a deficiency of water. Ennis & Co. and Neece & West are taking out considerable money. The ditches were all broken and flumes considerably injured by the storms, but the damage will soon be repaired. Williams' ditch is running water, and it is expected that Kidd & Co's ditch will bring in water by the end of this week.

22d: The Newark Co. last fall located and purchased the bed of Greenhorn creek from the crossing of the Grass Valley and Red Dog road up some eight or ten miles. A large double flume was securely bolted to the bed-rock, most of which withstood the severe freshets just passed. It is expected that the company will employ a large number of men this summer. The bed of this stream has never been worked, and as it is the recipient of tailings from the richest mines in Little York township, the company are confident of large returns.

During the past year many mining companies in Nevada county have been compelled to "shut down" on account of the enormous expense required to prospect, and the failure of the rock to pay large returns. In one instance over \$44,000 was expended in wages alone. There are, it is estimated, 400 men out of employment in Grass Valley township alone.

25th: The present season, with abundance of water, has been peculiarly hard upon miners. In every locality ditches were broken, flumes carried away, the snow has been deep, and the extreme cold has frozen up the ditches.

Arbogast & Nichols, who are engaged in working a quartz ledge near Rough & Ready, struck a pocket last week. In a single pan full they took out between \$400

and \$500. It is stated that they have taken out very large sums every day since.

Gazette, Feb. 20th: We understand that the sulphuret works at Canada Hill, erected a year or two ago to work by the Rivot process, are to be rebuilt and entirely remodeled. The process has, it is said, been so improved that the sulphurets can be worked at a cost of \$12 per ton, saving the silver as well as the gold. We are informed that the castings and other machinery for the new works are now being manufactured at San Francisco, and the purpose is to have the works in operation early in the spring.

25th: The Dromedary Co. has just finished cleaning up a crushing of 375 tons of rock from their ledge, which restarted in the neighborhood of \$10,000.

Grass Valley *National*, Feb. 19th: The Empire Co. at Ophir Hill, have realized \$22,211 during the past 20 days, and have averaged \$1,124 a day for the past four months. They are starting to drift on the 7th level and find a good ledge in the hot-ton shaft in going down for the 8th level. By the 1st of November, the superintendent expects to have four levels in working. The superintendent came in this forenoon with three bars of gold weighing 110 lbs. Further improvements are to be added to the mill; a dry house and retorting and smelting works, probably also ten additional stamps.

Feb. 20th: The Homeward Bound Co. has struck the ledge at a depth of 100 ft. and the rock at that depth gives promise of a good margin for profit to the company.

Feb. 22d: Mr. Shurtliff, while specimen hunting yesterday, found a piece of quartz containing some \$40 in gold.

Grass Valley *Union*, Feb. 25th: The New York Hill Co. are running ahead with the ten stamps of their own mill, are putting in ten additional stamps, and employ 16 stamps of the "Rocky Bar" in crushing their rock.

EXCELSIOR.—Feb. 23d: Steve Venard, who has recently visited the eastern part of the country, furnishes us with some interesting items:

The town of Meadow Lake has a population at present of about 75 or 100 persons. The snow is ten feet deep, and but little business is being done.

The Empire Mining Co. is at work, and the ledge is yielding fine looking rock. The Lake or White Rock ledge is also yielding fine ore.

The Mohawk & Montreal mill has been running during the winter. The ledge is better defined than they have ever before had it, and the ore is of a higher grade.

Placer County.

Herald, Feb. 22d: The McGonigle, Perry & Co. claim, on the Black ledge, is still being worked night and day with 8-hour shifts. In consequence of the breaking of the pump, about ten days ago, the workmen have been employed on the upper levels. The shaft is about 85 ft. deep, rich ore having been struck at 54 ft.

On the Fred Mallet mine, the owners are hard at work, night and day, pumping out the shaft, preparatory to commencing work on the ledge. The shaft is now 50 ft. deep. At 30 ft. they drifted 30 ft. each way—easterly and westerly. In the eastern drift, it shows rich in pure virgin gold. They then sunk 20 ft. further, drifted easterly again, and cut the ledge at 5 ft. from the main shaft, showing equally rich.

We were shown last week a beautiful specimen taken from the ledge of the Opwood claim, about 30 ft. below the surface. The ledge is about 6 in. wide, and from present indications is believed to be very rich. This claim is in the Auburn district, about two miles from town.

Plumas County.

National, Feb. 15th: We learn that the mines in Spanish Ranch and Meadow Valley have almost entirely suspended operations during the last few weeks on account of extreme cold weather.

At Sawpit Flat, the American Co. are working twelve men, and are making from \$8 to \$12 per day to the hand. The Buckeye Co. are working seventeen men and are making from \$6 to \$8 per day to the hand. The Union Co. are working seven men and are making an average of \$7 per day to the hand. The New York, Eagle and Union Cos. are taking out pay dirt, but will not be able to wash up until the weather moderates so as to give them water.

Indian Valley Correspondence: The Crescent is not running as yet, only engaged in pumping the water out of their mine; will probably start in a few days. The Whitney, Caledonia, Indian Valley Mill, New York, Judkin & Kellogg's Mill and the Pennsylvania are all busy at work. The Lone Star is stopped by the cold weather. The Bull Frog by a cave in the tunnel.

Tuolumne County.

Sonora Democrat, Feb. 22d: Work on the Rawhide mine has been resumed, and men are now getting out ore, but we are informed that it will have to be shipped to Europe for proper metallurgical treatment, owing to its being combined with tellurium.

The "Crosses" mine, on Whisky Hill, has a 40-foot vein, and the poorest of the rock worth \$10 per ton. A 10-stamp mill is to be erected.

ARIZONA.

From the *Miner*, Feb. 1st: The new placer diggings, four miles south of Prescott, still continue to shell out pretty freely. During the past week, Andy Stanehrook took out, in one day, over one ounce of gold. Next day he panned out \$9.50. In five days he panned out the sum of \$60. Judge Brooks has taken out considerable money. In fact all who are at work in the diggings are doing well. A party of Mexicans took out in one day, recently, we are told, about a handful of coarse gold. The largest piece found last week, weighed \$8.50. Mr. Pillow on Sunday last, told us that other gulches in the vicinity prospect nearly as well as the one now being worked.

We have received several letters from Wickenburg, all of which speak in glowing terms of the Vulture mine and mill. Wickenburg & Smith are taking out very rich quartz. Mr. Smith has gone to Arizona City for helting, and as soon as he returns, the Wickenburg 5-stamp mill will be started.

The news from the mining districts adjacent to Prescott is favorable.

COLORADO.

Rocky Mountain *Herald*, Feb. 8th: Mining is progressing steadily in Gilpin, Clear Creek, and Boulder counties, despite the low thermometers. Our mountain exchanges are daily speaking of fine runs and fair prospects, discoveries and doings generally. * * * Mining matters in Boulder county are reported to be encouraging. Two new lodes are being developed near Boulder, the Ironsides and the Hog's Back.

The Argentine, one of the eight rich lodes owned by the Red, White and Blue Co. (made up of colored people) has a vein of argenteriferous galena, the highest assay of which was \$1,800 per ton, and the lowest \$350. It also contains a quartz vein, threaded with sulphurets of silver four ft. wide, assaying \$2,000 per ton. The company contemplates sending an agent East to sell stock. They have extracted a good quantity of silver by smelting.

Haskins and Dishrow are running the Peck mill in Upper Empire on surface ore from the Gold Dirt lode, and are making it pay. They have a 5-ft. crevice. Andrew Mason is running the Tennessee mill on ore from the Silver Mountain lode. This lode was worked out as was supposed, several years ago. It pays now between \$90 and \$100 per cord.

Mr. Irwin has commenced work on the Prince Alfred lode, in Spring Gulch. Mr. Whitcomb is running his mill on ore from the Irish Flag, for Fleming & Co. The last clean up yielded \$84 in gold to the cord. L. E. Bowman, with three other colored men, are at work on the J. M. Matelly lode. They have sunk a shaft 14 ft., and have over two ft. of ore. The ore prospects well.

The Smith & Parmelee shaft is now at a depth of 443 ft. A rich ledge of iron has been opened up, during the last few days. The Red Rock lode, owned by Messrs. Hough, Thompson & Thomas, is now being rapidly developed. A shaft has been sunk 75 ft., and the ore will assay from \$200 to \$400 per ton. The Leavenworth shaft is now about 97 ft. deep, and has about four ft. pay in the bottom. We learn, that on Saturday, a rich vein of sulphurets, was discovered in the bottom of the Tows lode. Burdick & Co., of Georgetown, have found a new lode on Brown Mountain, which has a crevice four ft. wide. The discovery is a short distance above the Brown lode. Work on the Baker mine, west of Argentine, is progressing rapidly.

Letter from Boulder, Jan. 25th: Ni-Wot mill, as well as Haswell & Henry's ten stamps, and the Long's Peak mill, are pounding away cheerily. Altogether the district is much more lively than during any previous winter.

James Creek holds its own in population, and work is going on regularly, though the recent cold weather has frozen the stream so that mills and arastras are now all idle. The Potosi, which was exclusively gold-bearing on the surface, is now, at the depth of 120 feet, running into a very rich silver ore. In fact, this is the history of all the lodes in the district as they become developed.

In Gold Hill district all is hustle and life. The Hoosier is being worked vigorously, and development only adds to its character for strength and richness. Works for reduction will be put up in the spring

on an extensive scale. Running parallel with the Hoosier, and within a distance of 200 ft., three other lodes of about the same size and character have been discovered. A monster lode—in places 50 ft. wide—runs from Gold Hill in a straight line towards Boulder City, finally splits up into spurs, and ends in the formation immediately west of the limestone. Just inside the hog's back, and within one mile of Boulder, six of these spurs have been discovered and are now being developed. Within three miles, the Stanton lode is being developed. The vein is six ft. wide at a depth of 10 ft. The Blossom has assayed \$120 to the ton. Cord of pay ore, that would yield \$120 to the ton have been thrown out already.

A ton of ore from the Hoosier has been taken to the mill of Crosby & Thompson for treatment. Heavy bets are taken on the yield.

Register: Mr. Miley, running the University Co's 10-stamp mill on ore from the Bates-Baxter claim, took up 46 ozs. last week, at the rate of 7 4-5 ozs. per cord. Mr. Cremer is working a fresh lode, just back of the Enreka foundry. He is making it pay. Martine & Co. contemplate building a furnace in connection with the amalgamating works. Mr. Kenyon is sinking a shaft on the Kingston lode in the Russell Gulch. He is down about 80 ft., and the crevice seems to be widening.

DACOTAH.

Denver Herald, Feb. 8th: News from the Sweetwater mines is more romantic than real. It is certain there is gold in abundance through the Wind River range, but doubtless not a whit richer or more plenty than in parts of the Colorado and New Mexico mountains. The ignis fatuus of distance and isolation only adds "enchantment to the view" of a vast class of miners. The Sweetwater mines are 200 miles north-east from Salt Lake City, 105 miles from the stage road via Green river, 280 miles from Cheyenne City via the Lander road and Fort Halleck, and 180 miles from Cheyenne City via the North Platte, Pass creek and railroad survey.

Territorial Enterprise, Feb. 21st: C. W. Tozer writes thus from Salt Lake: In relation to the Sweetwater mines, I can only say that all the information I can get is of the most favorable character. I find here several old Californians and Washoeites who have been in the mines. Many will start from here next week, and some few have already gone on. I shall, I think, start in two or three days.

There will doubtless be quite a rush of prospectors from this State to the Sweetwater mines as soon as it is known that the roads are open. The news of the mines received here is vague. There are plenty of assertions of a general nature in regard to the richness and extent of the new mines, yet none, so far as we know, have been able to give facts and localities. Nevertheless there will be a rush.

A gentleman who arrived in this city from Salt Lake a day or two since reports the discovery of some rich placer mines in the vicinity of Independence Rock. He said there was much talk of the new mines in Salt Lake when he left. The mines are north of Independence Rock, and consist, so far as explored, in gulch diggings. The gulches are narrow, the depth of gravel slight, and the pay principally on the bed-rock and in dust not coarser than blasting powder. Those who first struck the gulches are said to have made from \$5 to \$8 per day, with very rude mining apparatus.

The Austin correspondent of the Territorial Enterprise, quotes the following from a Rock Creek letter of Feb. 2d: "My view of this country are not extravagant. I know there are big reports on the outside, and several thousand men will be here this season, most of whom will be disappointed more or less. This belt has quite a number of quartz ledges, and many locations have been made, but I don't think one-seventieth part are worth the recording. Three or four large, well defined ledges can be traced for several miles, and if they prove half as rich by mill working as anticipated, this will be the best mining camp known at the present day. Our quartz here is all gold-bearing, but I am not competent to judge from a prospect of the rock how it should pay by mill process. As for placer or gulch mines, they are very limited, and but few of them will pay anything.

My advice to you and other friends is—don't come this year, unless you want to take chances on some wild excitement. A year from this the mine will be proved to some extent, and if good there is room for several thousands. Then, again, I will say if times are dull, and you are not making any money, I advise you to come, and the sooner the better, before the roads break up in the spring. It will be lively here this

summer—Austin and Virginia City over again in early days."

MONTANA.

Post, Feb. 8th: A company organized a short time since, will have a furnace erected at Brandon, Mill Creek, in a few weeks, having some 6,000 ft. of good galena ores on Wisconsin Creek, and another company was organized at Mill Creek on Saturday evening last, by Messrs. Hartneth, Bowers & Co. who have arranged to commence the erection of a furnace and buildings at once. These two furnaces will be near the old quartz mill, and have abundant water power with plenty of fuel convenient. The leads are situated on an average half a mile from the site of the furnaces and prospect rich, have from two to five feet crevices, and efficient galena to flux them. It is intended to have both in operation in three months. Parties have conveyed 1,100 ft. of quartz to the latter company, who will commence smelting on the Passama, Mayflower and Slider ores. Mr. Hartneth pronounces the Mill Creek district ores fully equal to those of Argentina.

We learn from the valley that the Gallatin mill is running. The Penwell Bros. mill it is stated, will be completed in two or three weeks. Cover & McAdow are putting some new castings in their mill at Bozeman and will be running again shortly.

Helena correspondence: I visited the Lee Mountain lode the other day. It is a solid vein of 18 ft. in width. The ore is argenteiferous galena, antimony and sulphurets, which changes as it goes down, the galena and antimony decreasing and giving place to ruby silver. To the left of the cut is a piece prepared, and the ore that has been taken out, about 500 tons, corded upon it. We noticed some pieces that we judged to weigh at least 1,500 lbs.

This lode, taken all in all, is the best developed and best defined that we have seen in the country. I next visited the Esmeralda lode. The cut is 14 ft. wide and 26 ft. high, and runs into the mountain 120 ft. At its end is a shaft 10 by 12 ft. and 66 ft. deep. At the bottom of the shaft, a drift has been run the entire distance of 15 ft. through solid quartz, and the east wall has not yet been reached. About 750 tons of very rich quartz has been taken out.

I was informed by a gentleman who is not in any way interested in the lode, that he had obtained specimens of the poorest and richest qualities of the quartz and had carefully prospected it. The poorest he found to yield at the rate of \$267, and the richest the fabulous sum of \$13,000 per ton.

Mr. Hendrie will erect a 15-stamp mill near the ledge early in the spring.

On the Mexicana lode in Quartz Gulch, they have a shaft 38 ft. deep, seven by ten, and a crevice eight feet three inches wide. One ounce of rock, in which gold could not be seen without a glass, when pulverized and panned out without quicksilver, yielded 30 cts. to the pan.

The last shipment of bullion from Flint Creek, by the St. Louis & Montana Mining Co., was in the vicinity of 6,000 ozs. It was the purest lot of silver bullion which has been turned out, the whole of the bars assaying .970 fine, being a little purer than the stamped American silver coin.

The Union mill cleaned up on last Saturday, over \$4,000 from their last week's run.

A new discovery of bar diggings lately made in McClellan Gulch, is said to be very rich, the lowest prospect got on the bed-rock being \$1.50 to the pan.

The I. X. L. Co's 18-stamp mill on last Wednesday, cleaned up 296 ozs. as the result of the last week's run.

NEVADA.

Esmeralda.

Aurora Union, Feb. 13th: A mill is to be erected upon the Holmes mine near Columbus. We learn that there are about 25 miners engaged in that locality taking out ore which will pay well by milling process, and all are confident that they will have good times next summer.

The Wirttemberg Co. at Castle Peak, is now driving a tunnel to cut the ledge at the depth of 250 ft. It is now in 125 ft. The Co. expect to have the tunnel completed by the time spring opens, when they design building a mill. The ledge has been sufficiently prospected to prove that a large quantity of ore can be easily obtained that will pay from \$40 to \$50 per ton for milling.

Reese River.

The Reville of Feb. 15th, corrects the erroneous statements which have been made in regard to Maj. Sherman's progress in the Florida mine, and says: According to the calculation of the Major, the Florida and other veins belonging to the Co., will be cut in the shaft at estimated depths; but none of them have been reached yet. The

shaft has not yet developed the "critter," but has yielded only the country rock. That it will reach the Florida and other ledges, besides blind veins of value, we have not the least doubt. We make these corrections out of regard for Major Sherman, who has an aversion to erroneous statements concerning his plans.

Same, 17th: We learn that the 10-stamp mill of the Old Dominion Co., which was accidentally burned twelve days ago, will be rebuilt immediately. The estimated cost does not exceed \$20,000.

18th: The mill of the Manhattan Co. was closed this morning for the purpose of repairing the main shaft. It will remain closed about four days.

Silver Bend Reporter, Feb. 15th: The Belmont Co's mill is pounding away incessantly, with excellent results. The Transylvania ledge from which the Co. is at present taking ore, never looked better than now, and from it we learn is now raised as rich mineral as ever was produced from any mine in the district.

The new mill of the Combination Co., at East Belmont, is producing large amounts of bullion daily. The ore battery is said to be yielding near \$100 per ton more than the estimate placed upon it on the dump.

The El Dorado South Co. this week sent to Austin seven tons of ore for reduction. The lot was in every respect equal to that previously shipped and which yielded \$267.67 per ton. In the mine a level is in progress from the incline southward upon the vein. It shows no diminution either in quantity or the quality of ore.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Territorial Enterprise, Feb. 19th: A new boiler is being put in place in the Sunderland mill, Lower Gold Hill. As soon as the connections are made with the engine the mill will resume operations.

Preparations are being made to work a number of gold bearing quartz leads, in Devil's Gate district, this spring. Nearly all these leads will pay at the surface. The ore will be put through mills arranged after the California style. Pans will not be used—only copper plates and blankets.

Feb. 20th: It was rumored on the streets yesterday that a deposit of rich ore had just been cut in the Savage—upon the fourth level. We were unable to trace the rumor to any reliable source or to get any particulars.

Feb. 21st: Almost daily parties prospecting in this vicinity in the croppings of abandoned claims bring in very promising ore. As soon as the hills are completely bare of snow all the old claims in this city will be subjected to a thorough overhauling and doubtless some valuable deposits of ore hitherto unknown, will be found. Flowery, Silver Star, and Devil's Gate districts are the most promising for this kind of mining.

Feb. 22d: We yesterday saw at the office of E. Ruhling & Co., some very fine specimens of ore from the Overman mine—sulphurets tinged with carbonates of copper. One piece showed a considerable amount of native silver in thin leaves. The ore was taken out about 150 ft. below the surface.

Tresspass, Feb. 22d: The advance in Savage stock may be attributed to the cutting—most unexpectedly—of a fine body of ore which is yet undetermined. In the north drift fourth station, the ore is looking exceedingly well. In the south drift same station, the vein of ore has improved in appearance, and all the different levels of the mine are much improved. The usual quantity of ore is being mined and milled. In the Imperial, the west body of ore, mentioned last week, is opening up well. Work at the new shaft is as usual. In the Crown Point, the shaft has been retimbered, and next week the drift on the 800-ft. level will be continued. The new pump will soon be in readiness for labor. In the Overman, a fine body of ore has been developed in the south drift 360 ft. This body has been developed 12 ft. in width, and 18 ft. in height, but the entire size of the vein has not yet been determined, as the wall has not been reached. Ore is also extracted from the 400-ft. southeast drift, and here the body has widened and improved materially. Some of this bears free metal and is very rich. The other portions of the mine are looking well, and yield about 125 tons of ore per day.

Gold Hill News, Feb. 21st: We are credibly informed that Charley McWilliams has recently struck a rich lead in Slippery Gulch which assays rich right in the surface croppings.

NEW MEXICO.

Maxwell's Ranch correspondence of the Denver Herald, Feb. 8th: The weather and the water will not admit of actual mining at

Moreno, to amount to anything, short of June next, and my advice to one and all in your Territory is to keep out of here until spring. There is some little work doing here, however, this winter, where the parties are well provided for. Col. Henderson has just finished leasing, for the proprietor, Mr. L. B. Maxwell, 1,280 claims in the various gulches. The rent set on each claim (of 300 ft. by 300 ft.) is \$1 a month; the time ranges from one to ten years. So far, provisions are plenty and at reasonable prices. There are about 1,000 people in the various districts.

OREGON.

Jacksonville Sentinel, Feb. 15th: Mr. C. Nye called upon us this week, and reports that the mining interests on Foot's Creek are all frozen up. The same may be said of all the mining camps in the country.

A road is being made from the Occidental quartz mill to the Holman lead. It is the intention to proceed as fast as the rock can be transported to the mill to commence crushing. The mill has been carefully repaired, and the defective parts made new, so that it is almost certain that all the gold can be saved.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

- ANSTED'S Gold Seekers Manual. 1 vol. 12mo. cloth. 3
- ANTISELL.—The Manufacture of Photogenic or Hydro-Carbon Oils, from Coal and other Bituminous Substances, capable of supplying Burning Fluids. By Thomas Antsell, M. D. 1 vol. 8vo. 3 00
- BARSTOW—Sulphurets; What they are, How Concentrated, How Assayed, and How Worked; With a Chapter on the Blow-pipe Assay of Minerals: 1 vol 12mo. cloth. 1 00
- BLAKE, W. P.—Geological Reconnaissance in California in 1853-4. 4to., with plates, maps, sections, etc. 10 00

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

MR. A. C. KNOX, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.
MR. C. F. RANCEY is our duly authorized agent for Sacramento County. Nov. 29, 1867.DR. L. G. YATES is our duly authorized traveling agent. July 6, 1867.
MR. A. B. BUTLER is a duly authorized traveling agent for this paper. July 15, 1867.

San Francisco:

Saturday Morning, Feb. 29, 1868.

Notices to Correspondents.

H. B., San Francisco.—The manufacture of beer is very possibly as ancient as that of wine. History carries the use of beer back to the time of the Egyptians; and the Chinese, to whom all new discoveries appear to have been old facts, might have drunk, even centuries before the Pharaohs existed, as now, liquor made from bruised barley and wheat. Herodotus, writing 400 years before the Christian era, says that the Egyptians had a wine made from barley. Aristotle speaks of its intoxicating qualities. Theophrastus calls it the "wine of barley." Tacitus notices beer as common with the Germans in his era, and Pliny speaks of it as made by the Spaniards, who called it *celia* or *ceria*, and the Gauls, who call it *cerevisia*—all these titles being evidently derived from Ceres, the divinity of grain, as the present name beer may be derived from the Latin *bibere*. Since the Christian era, Nubia and Abyssinia, benighted as they were and are, claimed kindred with European nations, through a common taste for the nut-brown liquid. The Japanese has his rice beer, and the Northman and the Dane reserve in their ideal heavens spaces for reservoirs of their favorite beverage—beer.

A SUBSCRIBER, Virginia City.—The word opaque applies only to substances through which light is wholly intransmissible, such as chalk, coal, iron, wood, etc. Such bodies as opal, some descriptions of crystalline limestone, as that variety of which statuary marble is composed, milky colored flints, agates, etc., which partially permit through their substance the transmission of light are termed semi-diaphanous. The term opaque would be improperly applied in the latter quoted instances.

MANUFACTURER, San Francisco.—The manufacture of oil-cloth carpets requires heavy and expensive machinery. The market here would hardly warrant its manufacture on this coast at present. The paint now usually employed, is composed largely of slate ground to an impalpable powder; various kinds of clay are also used for mixing with the oil, the whole forming a kind of mineral paint. The paint is laid on by machinery, the cloth passing between heavy rollers suitably prepared for that purpose.

MILLER, Sacramento.—We know of no better material than melted sulphur and sand, with which to fill the cavities in millstones. It should be poured in while hot. Those who have used it say that it answers the purpose admirably, and is as durable as any material which can be employed. The danger of using lead for such a purpose has been made most painfully apparent within the last two years, in several cases at the East, where death or lingering sickness has resulted therefrom.

FARMER, San José.—The origin of sweet corn is not, and probably never will be known. Like the other varieties of corn, it was cultivated by the aborigines of this continent before its settlement by Europeans. That is probably as far back as we shall ever be able to trace its history. There are many sub-varieties, the histories of which might be given.

FOSSIL.—We can give no information as to the nature of, or whether any inquiry whatever has been made by the Senate Committee on Mines, as to the present condition of the State Geological Survey. We presume that during the present week, a report of some kind will be made to the Senate.

Atomechanics.

This as yet mainly "conjectural" science is based upon the idea that there is but one chemical element; and that those simple substances which we now call elements,—not having as yet succeeded in reducing them to component parts,—differ from each other only in the number and arrangement of their atoms. This single element is named *pantogen*,—or "universal generator," its atoms are called *panatoms*. These atoms are all exactly equal; and consist, so to speak, of simple points of one primary matter.

The propounder of this theory is Gustav Hinrichs. The idea was conceived while he was a student in the Polytechnic School at Copenhagen, in 1855; and during the two succeeding years he communicated a memoir upon the subject to several European scientists and various academies. Papers were, moreover, published by him in reference to it, from time to time, up to 1866; but during the last year, 1867, a complete outline of the "science" was lithographed and published in the form of a large quarto; the text being transferred from the author's own hand-writing, and the numerous diagrams from his own drawings.

Hinrichs asserts that a marked analogy is perceptible in the steps of advance made by the two sciences, chemistry and astronomy; and that as astronomy has now become a mechanics of the celestial bodies, we may conclude that some general principle exists, which will transform chemistry into a mechanics of the atoms. As the hypothesis of universal gravitation is the basis of astronomy, so the hypothesis of pantogen is, with him, the basis of chemistry. According to his theory, the panatoms combine in different forms, determined by their number. Three must necessarily form an equilateral triangle, since in that relation only can they be in equilibrium. An addition of more atoms will make hexagons and other figures, divisible into triangles. These figures are classified, or arranged in orders, genera, and species. We are not sufficiently acquainted with the arrangement of the system to go into particulars in regard to it. Nor are we aware of the nature of the reasoning by which he attempts to demonstrate it. He does not pretend to claim that it is by any means yet perfect; and reminds us that those men who enunciate the greatest truths are those who are obliged to struggle with the greatest difficulties to obtain recognition.

There is, to most minds, a certain charm in such generalizations; they are, nevertheless, not science until they are demonstrated. What the new "science" may yet bring us to, it is impossible to say. Attempts have been made, of late, to classify certain rocks by the aid of the compound microscope. The "basic" and "acidic" rocks, for instance, are distinguished from each other by the different arrangement of the particles as determined by that instrument. There is no telling what may yet be done. Even Sir Humphrey Davy, one of the lights of the scientific world, declared that he was by no means prepared to assert that the transmutation of metals would not come time be accomplished. The *ignis fatuus* so long pursued by the alchemists may, after all, be no chimera; "who knows?"

The above was written after a reading of a brief and imperfect notice of Prof. Hinrichs' theory. Since it was put in type, we have received the January number of the *American Journal of Science and Arts*. From an editorial note therein, by Prof. J. D. Dana, we learn that in March last, Prof. H., who, it seems, is now in Iowa, sent a paper upon the subject for publication in that journal. Prof. Dana being totally incapacitated, by sickness, for editorial labor, placed the paper in the hands of an assistant, Prof. Barker, who reported it to him as purely speculative, and as based upon as-

sumption merely, without proof. Prof. B. moreover said that the ideas advanced bore no resemblance to certain known views of Prof. Dana himself in regard to the connection between the number of atoms of oxygen in a compound and its crystalline form,—and to the possibility that the polarity might be due to the accumulation of the positive and negative atoms at opposite ends of the molecule. The paper of Prof. Hinrichs being shown to Prof. Gibbs, the associate editor, he advised its return to the author;—which was done. A second paper from Prof. Hinrichs, accompanied with an angry note, was also returned. In July, Prof. H. published "Atom Mechanics;" and then, for the first time, Prof. Dana, on examination of a copy of the work, saw a slight coincidence, in one part, with his own idea, although much involved with other hypothetical views. This was after he had published his own paper. Soon after, Prof. H. made a charge of plagiarism against Prof. D.; who wrote him at once that he should with pleasure give him full credit for priority of publication in any points where on further examination he should find that he had anticipated him; and he in fact published a note in the next number of the *Journal*, admitting such coincidence and priority. Notwithstanding this, the charge was made public by Prof. H., and has since been reiterated, in spite of an indignant showing of its falsity by Prof. Dana. Prof. Barker adds, to the above named editorial note, a statement, corroborative of that of Prof. D.; further stating, that he does not remember to have seen anything in the original manuscript at all resembling those views which in "Atom Mechanics," as published, approximate to those of Prof. Dana;—and that if they did appear there, they were so covered up by fanciful analogies as to make no impression upon his mind.

From the foregoing, we infer the probability that there is a grain of truth at the bottom of the new theory, although the structure erected upon that slight foundation by an enthusiastic generalizer may be, at least as yet, in great part, mere unwarranted speculation. When a man of such acknowledged scientific merit as Prof. Dana conceives and publishes a hypothesis, it is worthy of attention. If, then, Prof. Hinrichs' views really exhibit, in any point, a coincidence with those of Prof. D., he also is worthy of attention; and if that coincidence should appear ascribable to "independent action in independent minds,"—then so far, at least, the credit belongs equally to each. There is no doubt that Prof. H. has carefully studied Prof. Dana's work on mineralogy, and derived therefrom much valuable information upon the subject of crystallography. This work was published in 1854; a year before Prof. Hinrichs' "discovery" (or invention) of pantogen.

FULL FILES OF THE SCIENTIFIC AMERICAN.—Inventors and others will be pleased to learn that the Mechanics' Institute, of this city, has just added to its library a full set of the *Scientific American*—including every issue of that valuable journal from its commencement to the present time. This series has been procured only with considerable difficulty, and was secured for the Institution by Mr. A. T. Dewey, one of the proprietors of this paper. This is said to be the only full edition of the *Scientific American* on the Pacific Coast. It has heretofore been much needed in this city, as a work of reference by our inventors and scientific men.

PATENT BUSINESS.—Eight applications for patents, and four caveats, will be forwarded to Washington by the steamer of to-day, from the MINING AND SCIENTIFIC PRESS PATENT AGENCY; besides one application for a foreign patent. The inventors of the Pacific coast are more active than those of any other section, containing an equal population, in the Union.

CALIFORNIA FEVER AGAIN BROKEN OUT. People are again waking up to the attractions of the Pacific El Dorado. According to the *New York World*, the departures for this coast during the last three months remind one of the early rush of the gold-seekers. One of the proprietors of the Press, now in the East, writes us by the last steamer, "Everybody is coming to California."

Why should it not be so? The inducements are far greater than ever before. California is now, *par excellence*, the land of homesteads and abundant breadstuffs. Gold-digging is a matter of secondary importance,—although our mines are by no means yet exhausted; for men now begin to appreciate the comparative certainty of a competence, which the wonderful richness of our soil promises to those who will till it. If, however, a man will dig for gold in these days, he can do so at the door of his own white cottage with green blinds and climbing vines,—instead of a forty-niner's hovel; and after his day's work, he can sit down, at a clean table, to a clean supper, prepared by the hand of a neat wife,—instead of going to work, tired as he is, to build his own fire, and fry his own greasy salt pork and leathery flap-jacks. The diseases which carried off so many of the first comers, and which were charged by *les miserables* to the "God-forsaken country,"—instead of to disappointment, and anxiety, and improper food, as they should have been,—are now almost unknown. Abundant supplies of the finest vegetables, and the choicest fruits, are to be had almost without price,—where once beans and dried apple were the chiefest luxuries. The climate is such and so various that every man can be suited, be he native of Maine or of Mississippi. The old folks at home can be visited at a week's notice as soon as the iron track, now so rapidly extending itself, is completed.

There is room enough;—and they will come. There is no mistaking the future of this golden State. The "star of promise," which, for one generation, has been steadily moving westward, now rests at last over California; and the "wise men" see it.

MR. WADSWORTH'S LECTURE.—The lecture on wine, silk, etc., on Wednesday evening, though rather thinly attended, owing to the bad weather, was listened to with great attention. Mr. W. was present at the Paris Exhibition, where he lost no opportunity to say a good word for this State. The California specimens of wine, of cocoons, and of hops, there shown, as compared with the best exhibit of the same from other countries, established beyond a doubt the certainty that we can beat the world in either product. The French Commissioners who shrugged their shoulders at the cane sugar wines of the Atlantic Coast, pronounced the California wines European. The silk men of Lyons, on the strength of six cocoons which Mr. W. had with him, spun by worms of Wilson Flint's raising, dined him, and wine him, and drove him all over the country. "They could not do too much for a man who had six such cocoons." The brewers all wanted samples of the California hops,—brought paper bags to fill with them, and sent all their friends with paper bags for the same purpose. Every large brewery in Europe obtained a sample, through an agent. The lecture was well worth listening to, and fully confirmed in their faith all believers in the future of California.

GREAT SALT LAKE.—It is said that the waters of the Great Salt Lake of Utah, rose last year three feet above their former level, and are still slowly rising. This lake drains an immense region, and has no visible outlet.

TO CORRESPONDENTS.—Two communications from "C. H. A.," and one from "A Practical Mechanic," will receive early attention.

Editorial Correspondence.

IMPROVEMENT IN BLASTING.

One of the most positive improvements lately adopted in the Hoosac Tunnel, in Massachusetts, and also in some of the copper mines of Michigan, is the use of the

ELECTRIC BATTERY

With patent exploders, the latter containing fulminating powder. The exploders, with the necessary insulated copper wire for forming connection with the battery, cost but a trifle more than first quality of fuse. They are placed in the center, instead of on top of the charge, and fire the powder so that its entire explosive power is obtained at once, increasing its effects. In addition to this, numerous charges are exploded simultaneously, combining, more or less, their united force against the strength of the rock. There is no mistaking that important advantages are thus derived, sufficient to warrant the belief that the practice will be introduced into most large blasting undertakings. The battery used is termed an ebonite battery. It is simple in construction, resembling in appearance a large lock about 8x12 inches. A vulcanized rubber friction wheel produces the electricity. When the wire connection is made with all the holes designed to be fired, a few revolutions are given to the crank, a small knob is pulled (completing the circuit), and all are instantly discharged. It is much surer and safer than the operation with mining fuse.

DR. EHRLHARDT'S PATENT SAFETY POWDER.

Practical tests of this new compound are being made on a large working scale. Its use in submarine blasting on Corwin rock, in Boston harbor, has been highly satisfactory. By the use of four cases, in six days 150 tons of rock was removed. The best of gunpowder had proved ineffectual. The powder is of a brownish color, fine as snuff; burns in open space as moderately as saltpeter. Entire absence of air is necessary to produce explosion; handled same as common gunpowder. Its power can be made from two to six times the force of gunpowder. Several years since, before Dr. Ehrhardt had perfected his powder, it was tested in the Hoosac Tunnel with decidedly economical results. But by some blunder an accident occurred, a life was sacrificed, and the powder rejected. If, in continued use, it proves favorable, our readers will be further informed. We are indebted to Gen. J. G. Foeter, Lieut.-Colonel of Engineers in Boston harbor, for information on the subject.

THE BLACK DIAMOND DRILL.

The Windsor (Vt.) Manufacturing Co. are making a diamond drill quite different from the annular or tube drill (which formed a large central core and proved a failure). The new one has a solid drill head, cutting the full size of the hole. This gives it greater strength and better facility for setting the diamonds so as to hold their position, with less liability to loosen. The diamonds used are dark, opaque, and imported for the purpose. They are worked by a small oscillating engine attached to the drill-carriage, and connected with a flexible supply tube. Two men can carry one. It is quickly adjusted for work. The proprietors state that after boring over 500 feet in granite, quartz, talo and marble, with one drill-head, the diamond points showed no wear. The Windsor Manufacturing Co., owners of the various patents under which the machines are made, will soon have one tried in the Hoosac Tunnel. We shall probably report the result, and in course of time give an illustration of the machine.

The Burleigh air drill (which will be noticed fully in an article on the Hoosac Tunnel) is worthy the consideration of Californians; as is also the new process for manufacturing nitro-glycerine, by Professor Mowbray, at the same tunnel.

A channelling machine, for cutting etone in marble and other quarries, which has been well tested by use, is another labor-

saving tool manufactured by the above named company. Engravings of both machines may be seen at our office.

WOOD SUBSTITUTED FOR PAPER-HANGING.

Parties in Boston are exhibiting sheets of wood shavings, or veneering, no thicker than heavy writing paper, as a substitute for wall paper. When fastened to the wall and properly finished, it appears rich and ornamental, showing the natural grain of the timber. Its manufacture is considered a success by those who have the matter in hand. Mr. Edward Jewett, of Rindge, N. H., has been experimenting in this direction for several years, and has invented and patented a machine which he thinks can be constructed so as to do the work satisfactorily. He is seeking funds at present to put it in operation.

[This substitute for paper hangings was noticed in our issue of the 15th inst.]

SHOE-PEGGING MACHINES

Are among the novelties to be seen in many of the boot and shoe manufacturing establishments in Massachusetts. A strip of birch wood four or five inches long, of the thickness of a shoe peg, its breadth the length of a peg, with one edge beveled to form the point of the peg, is introduced into the machine. The shoe is slipped into position, and a few turns of the crank punches the holes, splits the pegs, and drives them quicker than this sentence is read. At Mr. C. T. Sampson's factory, in North Adams, Mass., one machine will peg a shoe in eleven seconds, and turn out fifty-six pairs per hour.

Westfield, Mass., Feb. 4, 1868.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS & JESSUP, corner of Montgomery and Sutter streets, over Tucker's Jewelry Store, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with PURE GOLD—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14-1f

Miners, Visitors to mining districts, R. R. EMPLOYEES, and TRAVELERS generally, should insure against all ACCIDENTS in the Traveler's Life and Accident Insurance Company of Hartford before leaving the city.

WM. MCCOONALD & CO., Gen'l Agents, 7v16-g9p 121 Montgomery St., opp. Occidental Hotel.

Accidents.

The Traveler's Insurance Company, of Hartford, Ct., insures against death or disabling injury by accidents; \$3 to \$50 per week paid the assured in case of injury preventing the prosecution of his business; \$500 to \$10,000 paid to his family, or legal representative, in case of his death by accident. No medical examination required.

WM. MCCOONALD & CO., Gen'l Agents, 121 Montgomery st., San Francisco, Opposite Occidental Hotel. 2v15-3m

It is an UNFAILING REMEDY in all cases of Neuralgia Facialis, often effecting a perfect cure in less than twenty-four hours, from the use of no more than two or THREE PILLS.

No other form of Neuralgia or Nervous Disease has failed to yield to this

WONDERFUL REMEDIAL AGENT.

Even in the severest cases of Chronic Neuralgia and general nervous derangements,—of many years standing,—affecting the entire system, its use for a few days, or a few weeks at the utmost, always affords the most astonishing relief, and very rarely fails to produce a complete and permanent cure.

It contains no drugs or other materials in the slightest degree injurious, even to the most delicate system, and can always be used with

PERFECT SAFETY.

It has long been in constant use by many of our most EMINENT PHYSICIANS, who give it their unanimous and unqualified approval. Sent by mail on receipt of price, and postage.

MECHANICS' INSTITUTE.

REGULAR TICKET.

Election, Monday, March 2, 1868, FROM 12 M. TO 9 P. M.

At Rooms of the Society, No. 29 Post st.

The undersigned Committee, appointed by the members of the Mechanics' Institute at its annual meeting, held February 6th, 1868, for the purpose of nominating officers for the ensuing year, have the pleasure of presenting to members for their approval the names of the following gentlemen.

In selecting your nominees, the Committee, in obedience to the voice of the members, have presented to each candidate for his endorsement the following questions, which have been fully approved by them:

1st—Economy and retrenchment in all matters relating to the affairs of the Institute and its proposed Industrial Exhibition.

2d—Individual and collective effort to afford instruction to junior members and apprentices by means of classes, lectures, increase of library and other available means.

3d—Faithful support to the principles of Eight Hour labor.

4th—To engender friendly and kindly feeling between members, especially in debates.

5th—Hearty and indefatigable co-operation in insuring success in the forthcoming Fair; voluntary services by Executive Committee, no member of which shall have direct or indirect interest in any pecuniary transaction arising therefrom.

W. B. EWER,
C. R. STEIGER,
N. W. SPAULDINO,
C. F. BASSETT.

For President,

Life Insurance Company,

OF NEW YORK.

Assets, - - over \$3,000,000.

Number of Policies Issued in 1867, 10,360.

Amount Insured, - - \$31,375,071 00.

POLICIES ISSUED AT ONCE,

On receipt of Application at the San Francisco Branch Office, without referring to the Home Office at New York.

Policies Paid in Gold Coin or Greenbacks, at the option of the person insuring.

[Extract from report of the Home Office, for Dec. 1867.]
"The Company's history for the past fifteen years shows favorably, and it stands out-day ranks it among first class Societies. It has carried out in good faith every contract made by it, never contesting a Southern claim during the war, while it is well known that many of our largest companies repudiated their Southern risks at the commencement of our National struggle, thereby increasing their assets. This honorable dealing of the Knickerbocker in the past, is a pledge of its future good faith."

DR. FONDA'S

San Francisco Eye Infirmary.

Permanently established for the treatment of all diseases of the Eye. Dr. F. was for seventeen years principal of the Lafayette (Ind.) Eye Infirmary. F. W. FONDA, M. D., Surgeon in Charge. Office, 402 Montgomery street, opposite Wells, Fargo & Co's. 4v15-1y9p

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—Best in use; W. A. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Carve Pan, Zenos Wheeler's improved flat bottom pan, Beldin's pan, Yeatch's tubs, Prater's concentrators, Wakley's pans, Boers' pan, German Barrels, Arastri Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

NITRO-GLYCERINE AND GUNPOWDER.—

Webb & Co., the English representatives of Mr. Nobel, write thus to the London Mining Journal, of January 4th, in reference to the comparative safety of the use of these two explosive agents:

The utility of blasting oil is proved by the increasing demand, and by the fact that in some quarries the men, who pay for it themselves, make their bargains dependent on a supply being guaranteed by the quarry proprietor. As to the dangerous character of the article, tons are annually used in this neighborhood, and a larger amount is expended on it in some quarries than on gunpowder; and, though accidents are constantly occurring from the use of gunpowder, we have heard of two only arising from nitro-glycerine, and these were occasioned by a total disregard of the printed rules laid down for its use.

In the quarries with which we are immediately connected, two fearful accidents have occurred from the use of gunpowder within the last five months. In one case a spark from a match fell on some loose grains, which served as a train, and fired the blast before the man had time to get away; and in the other, a quarryman of great experience, in attempting to remove the tamping from a hole after a misfire, was blown up. Last week, only, we had two misfires at the same time, and in the same tunnel, in holes, one of which was charged with gun-cotton and the other with nitro-glycerine. The gun-cotton was, in accordance with the directions of the manufacturers, abandoned. It was too dangerous to attempt to recover it. We lost the man's labor in drilling the hole, and the charge itself, and had to prepare another blast in a less suitable position. In the case of the nitro-glycerine, we simply removed the defective fuse, and substituted another, passing the percussion cap through the water tamping, without the slightest risk or difficulty, and fired the blast, which did its work effectually. With such experience, and numerous other instances constantly brought to our attention by the managers of other quarries, we are justified in our assertion that nitro-glycerine is not so dangerous as either gun-cotton or gunpowder, if ordinary care be observed in its use.

After some remarks upon the late Newcastle accident, they go on to say:

If persons using blasting compounds, no matter whether gunpowder, gun cotton, or nitro-glycerine, will act in open defiance of all rules for their protection, accidents must occur, and they must take the consequences; but to prohibit the use of such compounds is impossible. We cannot stand still while our neighbors avail themselves of modern improvements.

THE SUEZ CANAL.—There is every reason to suppose that the great ship canal for the passage of vessels of the largest size, between the Mediterranean and the Red Sea, will be completed next year at the specified time. An English engineer has given his opinion to that effect. This great work will revolutionize commerce and reduce the distance between Europe and the East more than half, with a corresponding diminution of expenses. It will also considerably reduce the distance between New York and the East, although its importance to America will be somewhat diminished by the completion of the Pacific Railroad. It is the greatest work of Louis Napoleon's reign, for to him belongs the credit of sustaining the persevering efforts of M. Lesseps, the celebrated engineer. Light-draught steam tugs can already pass from Port Said on the Mediterranean to Suez on the Red Sea. A regular monthly service of twenty-four of these vessels has been established between the two ports, and merchandise to the amount of 1,000 tons a day can be transported. The transport for the entire distance of 100 miles occupies four days, in consequence of the obstacles interposed by the steam dredges that are excavating the channel for large ships. No break of bulk takes place. This alone is an important achievement, and goes far to warrant the most confident anticipations of the ultimate success of all the original plans of this great work.

PORCELAIN GLASS is now manufactured in New Bedford, Mass., for photographic plates. The glass is first blown into hollow cylinders, four feet long; it is then cut longitudinally, flattened in a furnace, and cut into plates of the required size.

Japanning!

EQUAL TO ANY AT THE EAST, DONE ON ALL KINDS OF Hardware and Carriage Work. Damaged Goods re-Japanned; Sewing Machines Japanned and Ornamented. 513 Fourth Street, between Bryant and Welch, San Francisco. 5v16-3m

N. A. BELL & CO., Prop'rs.

A MUSEUM OF FIREARMS.—An establishment has lately been founded in London, the object of which is the collection and exhibition of specimens of every known principle and system applied to guns, rifles, carbines, pistols, and all other small arms; also samples of all explosive compounds, projectiles, cartridges, cartridge-cases, cartridge machines, wadding, etc., with the accessories and implements used. A shooting range is attached to the establishment for the trial of small arms and projectiles, and is provided with instruments and appliances for ascertaining what is necessary to the perfection of really useful and efficient weapons. One of the adjuncts is to be a library, which will embrace the principal standard works on firearms, projectiles and explosives, and also specifications of patents for firearms, and copies of those journals which more especially devote their pages to these subjects.

ANTHRACITE.—Anthracite coal was introduced into Philadelphia in 1822 by a Mr. George Shoemaker, who brought it from Schuylkill region, Pa. At the place now known as the Centreville mines, he loaded nine wagons with this coal, and carried it to Philadelphia. With great difficulty he succeeded in selling two loads, and the other seven he gave away—not being able to persuade the people of the value of the new fuel. Now Pennsylvania produces over 10,000,000 tons of coal per year.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, **THE GOLDEN ERA** is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome **THE GOLDEN ERA** as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

National Mineral Land Law, Instructions,
Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address DEWEY & Co., office Mining and Scientific Press, San Francisco.

Machinery.

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so grandly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

SAN FRANCISCO.

DR. BEERS' PATENT

WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Placer Miners is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this loss alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address

DA J. B. BEERS, San Francisco,

Per Wells, Fargo & Co's Express.

NOTICE TO MERCHANTS
—AND—
MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possess many advantages over the common Hoist—viz: Greater strength; less danger in working, as goods require no slinging or landing, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any fastening or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

VULCAN IRON WORKS CO.

2x15 1st JOSEPH MOORE.

HUNGERFORD'S

Improved Concentrators.

MR. HUNGERFORD, having been absent in the interior during the summer months, and engaged in the construction of several Quartz Mills, which have also been supplied with his CONCENTRATORS, has now returned to this city, and is prepared to answer all orders for his Concentrators, which are built either at the Miners' Foundry, in this city, or at Ooss & Lombard's, in Sacramento.

Orders addressed to him at this city, by mail or express, will be promptly attended to.

2x15 1st MORRAN HUNGERFORD.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$4000

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

EXPLANATION OF THE ABOVE ENGINES.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 24, 1885.

JAMES BRODIE, Esq., San Francisco: My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,

R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED OERMAN AMALGAMATOR BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1884. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the Improved Oerman Barrel, for a longer term than twelve months. All persons desirous of compromising, without having recourse to legal proceedings, for past infringements, or desirous of receiving Letters of License for the limited period named, are requested to address as below. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1885.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

For drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1885.

JAMES BRODIE, Fulton Foundry, or CHARLES RADOLPH, Express Building, 402 Montgomery street, San Francisco.

THE CELEBRATED
Self Generating Portable
Gas Lamp.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor. Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State.

18x14 3m-5

Notice to Miners,

Well-Borers and Water Companies.

Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG, 8x13-1y Stove Store, No. 125 Clay street, below Davis.

BLAKE'S PATENT
QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1886.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

Wood Tin in Place.

At the late annual meeting of the Miners' Association of Cornwall and Devonshire, England, Mr. G. M. Henry read a paper on the occurrence of wood tin at the Great Wheal Vor mine, from which we extract as follows:

It will doubtless be interesting to the members of the Miners' Association of Cornwall and Devon to learn that wood tin has been raised from a stope below the 162-fathom level on the Wheal Metal lode of the Great Wheal Vor United Mines, near Helston. Wood tin, so called from its woody appearance, was supposed by some at one time to occur only with stream tin. Wood tin has, however, been raised, and some good specimens preserved, from lodes in the neighborhood of St. Agnes, viz: Wheal Coates, Wheal Coit, and Wheal Trevaunance. It has also been found in mines at Giumear and at Sancreed; but I cannot find that it was ever discovered before in any other mines in the vicinity of Helston. There is a peculiarity about the wood tin raised from Wheal Vor; for it not only resembles wood, but assumes a uniform or kidney shape, and also occurs in large blisters similar to the blistered copper so commonly found in Cornwall.

No doubt many persons will remember hearing of an extraordinary deposit of tin in Wheal Metal, and of a winze which was valued at £500 per fathom by the agent of the mine. This winze was sunk below the 162-fathom level, nine feet by twelve feet. The lode itself in this winze was about six feet wide, and branches and floors of tin were carried with the other three feet, still leaving branches and floors bearing away north. It was a few fathoms west of this winze, and about four fathoms below the 162-level, that we discovered the wood tin. The lode and branches at this point are being stoped for a width of twenty feet, and the whole is worth fully £1,000 per fathom. The lode itself is six feet wide, and worth £600 per fathom. The wood tin is found in one part of the lode in this stope, mixed up with ordinary crystallized tinstone, such as we have been raising throughout the mine. Specimens of tinstone with impressions of the crystals of some other mineral have been obtained from the lode in the same stope, and are found mixed with the wood tin. In this part of the mine we have had a good deal of chlorite, chalcodony, dolomite, and feldspar, with a very peculiar form of mundic. It is strange that the occurrence of wood tin should be limited to this part of Wheal Metal.

EL DORADO COUNTY.—A Placerville letter to the *Amador Dispatch* of Feb. 22d, says: The placer diggings here have been exhausted only so far as came within the reach of water. There has never been but one ditch in this region, and the auriferous ground coming within its influence has doubtless been well washed out—but there are thousands and thousands of acres of auriferous soil (and probably as rich as ever worked hitherto) around the town of Placerville. * * * Now, it appears that a resident of this place has for years had a charter or franchise for the making of a ditch from Silver Lake, which would be the means, if constructed, of laying bare untold wealth. * * * This person has had the offer of the labor of hundreds of miners to complete the ditch—they proposing to take pay in water, and still he refuses to go on. Moreover, we are told that capitalists offered to proceed with and finish this work, yet he refuses their aid unless he has the controlling power in his hands. Here is a vast auriferous region absolutely within the power of one man. * * * It is to be hoped that this individual may be brought to his senses, and that speedily,—if we have stated matters correctly, and our information has been obtained from gentlemen of the highest respectability.

ECONOMICAL GOLD MINING.—Mr. Arthur Deane, the consulting engineer of the Vigra and Clogau Gold Mine Company, states in his last annual report that that company has realized a profit of \$2,500 for the year's operations, on quartz that averaged only 1 dw. 17 grs. per ton. The mine is of but limited capacity.

The St. John del Rey, an English company operating in Brazil, have been for some years dividing about \$500,000 annually, on rock that averages only from five-eighths to three-fourths of an ounce per ton.

HINTS FOR GAS CONSUMERS.—The following is condensed from the *American Gas Light Journal*:

It is a common occurrence for consumers who have not given the subject attention, how remarkably the light derived from gas is reduced by improperly constructed burners, or where the pressure on the flame is unsuitably adjusted.

It would be difficult to convince those who have not given the subject attention, how remarkably the light derived from gas is reduced by improperly constructed burners, or where the pressure on the flame is unsuitably adjusted.

The most important requisites for good burners are that the orifices should be perfectly regular, and of proper size to permit the gas to issue with a very low pressure. If the orifices are too small, a high pressure is required to expel the gas, and the light is diminished just in proportion to the increased pressure. In such burners the flame will have a bluish tinge, and the lower part will be of deep blue color. As an example: An argand of gas at one-tenth pressure, yielding a light of twelve candles, will, if the orifices are reduced to pass the same amount of gas per hour at five-tenths pressure, give the light of six candles—a loss of fifty per cent.

Again:—It is a mistake to suppose that the amount of light obtained will be in proportion to the quantity of gas issuing from the burner. There is a particular point in the consumption of any class of burners where the maximum of light is derived, and any deviation from this entails loss.

As an example, if an argand-burner, consuming five feet per hour, giving the light of twelve candles, be reduced, so that only three-fourths of that quantity is burned, then the light, instead of being equal to nine candles, the theoretical proportion, will be equal to that of six only. This reduction may be continued with even greater proportionate losses. A five-foot bat-wing or fish-tail burner, will give a maximum of light in proportion to the gas consumed, compared with any less sized burner, and it will be found in practice that the larger sized burners are the most economical.

The large size give as high as 200 or 300 per cent. advantage in light as compared with the smallest sizes.

As an example, the bat-wing burner, consuming two feet per hour gives the light of two and a quarter candles only, while a burner consuming seven and a half feet per hour gives the light of twenty-two candles, the pressure being uniformly four-tenths of an inch.

The knowledge of these facts is of importance to the consumer, who may, in his endeavor to economize, obtain results directly opposite to his anticipations. It is more economical to have one good large gas light than several small ones.

NEW COMFORTS FOR RAILROAD TRAVELERS.—A novelty in railroad travel is the introduction of family coaches, or cars, on the line between New York and Chicago. These coaches are so arranged as to accommodate families with the privacy of a hotel. Each apartment can be arranged at night to accommodate comfortably six passengers, and during the day afford all the comforts of a first-class drawing-room. Each car is supplied with the best improved amusements, which connect each room with the servants' apartments. Passengers have only to touch the bell to summon servants, who accompany each car.

"The Excellent"

Will not repair broken limbs nor leaky roofs; but it will quiet the nervous and brace up the weak. It will give more comfort to those suffering from dyspepsia or indigestion than any preparation you ever tasted or heard of. The first physicians use it, and it is made by

Manzanita Pipes!

WHOLESALE AND RETAIL.—SALESROOM, No. 53 Third street, near Mission. Factory, No. 10 Stevenson street, near First. San Francisco. These Pipes are manufactured from the best Mountain Manzanita, as sweet as Meerschaum. 2v15 3m **JACKSON & SPAULDINO.**

SINGULAR EXPLOSION.—We learn from Dr. J. A. Veatch, who is now sojourning for a short time in this city, that the spontaneous bursting of a saw-log, with explosive violence, occurred at the Port Trinidad sawmill, Klamath county, in December last. It was a section of a redwood tree, five feet in diameter and sixteen feet long. It had just been brought from the forest, and was in position to be rolled on to the carriage of the mill, preparatory to being cut into boards. The workmen had only a moment left its side when it split asunder nearly into equal halves, the parts separating with a bound to the distance of a yard or more; the noise was something like that of a gunpowder explosion.

The facts were related to him on the spot, by eye witnesses, a few hours after the occurrence. A singular phenomenon was also reported to him by a lumberman, where a redwood log forty feet long, while being hauled from the woods, split apart through its entire length, commencing at one end and passing rapidly to the other, but not with explosive force. The two sides curved in opposite directions as the separation took place. These instances of splitting were probably due to unequal tension among the fibers of the log,—of the same character as the rents that are known to occur in extensive solid masses of rock in mines. The singular fact of rents occurring in compact rock formations without the intervention of any exterior force, has been observed in deep mines both in Europe and America. As no earthquake shock occurs in such cases, and the sides of the rents remain facing each other, and only a loud bursting report is heard at the instant, it is perhaps rightly attributed to internal tension. Rents suddenly formed, with a report like a cannon fired off, the sides separating a foot or more, and extending laterally and vertically several hundred feet, are on record. We are not aware that such occurrences are frequent; but it would be interesting for lumbermen to note facts of like character, whenever they do occur.

Go to C. Muller, if you want a pair of Brazilian pebble spectacles, 205 Montgomery street.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-alm

ANOTHER CALIFORNIA ENTERPRISE.—A Factory has been started in this city for the manufacture of AUSTIN'S CELEBRATED BRILLIANT PASTE BLACKING. This preparation not only produces a most brilliant polish; but, unlike imported Blacking, it is pronounced the best LEATHER PRESERVATIVE ever introduced. Trade supplied twenty per cent. less than any imported article. Factory, No. 1 Montgomery Court, near the corner of Broadway. 26v15-3m

MEDICAL AUTHORITIES have announced that not less than one-fifth of the entire population of the United States are afflicted with Neuralgia in some form. Surely the man who can safely remove such a vast aggregate of pain is a great public benefactor. Such is Dr. Turner, of Boston, in Massachusetts. His "Universal Neuralgia Pill" is pronounced on all hands, to be an entirely harmless and perfectly certain remedy for this most torturing of all known diseases. See advertisement in another column.

The Photographic Landscape Rock.

The Eighth Wonder of the World!—A Puzzle for Geologists!

On Exhibition at the
S. E. Corner Montgomery and California Sts.

THE EL DORADO PHOTOGRAPHIC LANDSCAPE CO. have on exhibition, at the southeast corner of Montgomery and California streets, a number of LARGE SLABS of the PHOTOGRAPHIC LANDSCAPE ROCK, from the famous quarry at Pleasant Valley, El Dorado County. Some of these slabs are five feet long and three feet wide, and they are PAINTED BY NATURE, IN COLORS, with Landscape Views, which run through the rock, being the same on both sides of the slab, no matter how thick or how thin. These Landscapes look as if they were photographs of the adjacent mountain scenery, representing Mountain Ranges, Hills, Forests, High Rocky Points, Lakes, Caves, Sea Beaches, and Plains. There are also pieces which look like the Grain of Wood. Geologists acknowledge that nothing has been found elsewhere of the same kind, and they are unable to explain its formation. **ADMISSION, 25 CENTS.** Open Day and Evening. 26v16-1m

HANSBROW'S CHALLENGE Deep-Well, Mining and Double-Cylinder Patent Pumps.

These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Stemm, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents,
LOCKE & MONTAGUE,
112 and 114 Battery Street, San Francisco.

Six-Inch Mining Pump.

A. T. DEWEY. C. W. M. SMITH. W. B. BWER.
THE BEST IN AMERICA.

The Mining and Scientific Press,
Is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises six pages (24 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine bolder or worker, it is worth many times its subscription price. It contains a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS,

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The Mining and Scientific Press is now in its FIFTIETH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866:

RESOLVED, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

SPECIMEN NUMBERS of the Press and Patent Circulars, sent free.

MOSHEIMER'S NEW ROASTING FURNACE.

Patent applied for.

This Furnace has proven the most successful of any ever built on this Coast. A great number are in use now, and many in course of construction. Their superiority over all other furnaces, is as follows:

- 1.—The cost of building is only \$300 for a one ton Furnace.
- 2.—They require less than half a cord of wood per ton of ore.
- 3.—The ore is roasted to a spongy condition; while in a common Reverberatory it cakes into globules,
- 4.—It is a saving of 50 per cent. of labor over any Furnace in use.

A full size working Furnace can be seen at my Metallurgical Works in this city, by applying at my office.

JOS. MOSHEIMER,
328 Montgomery street, San Francisco.

A Sulphuret Mine Wanted.

Any party having for sale a Mine, with Gold-Bearing Sulphurets, of not less than 15 per cent., and which pay at least \$50 per ton, can find a purchaser by addressing, in writing, particulars to

TABLE OF CONTENTS.

Hallidie's Improved Suspension Bridge—Illustration—What they are, and their possible connection with the Pictured Rocks. Another Letter from Sierra Gorda. The "Pictured Rocks." Mechanics' Institute Election. New Process of Engraving. Pamphlet Accident. Telegraph Wires. A Silent View of Vesuvius. Artificial Stone Velocity of Musket Balls. A New Fibre. Danford's Steam Generator. California Academy of Natural Sciences. New Enterprise—Wood Processing. Idaho Fossils. Mexican Silver. The Idaho Mines. Mechanical. MISCELLANY.—The Martin Steel Process. Good Tools; Tung-Ten Steel; European and American

Locomotives: Breaking of Cyl. Wheels; To Polish Steel; New Lathes. SCIENTIFIC MISCELLANY.—Copper not so generally Offused in Nature as has been supposed; Transmutation of Air; New Genus of Corals; Binocular Eye; Piece for High Powers; Glacial Action in Vermont. MINING SUMMARY.—Comprising late intelligence from the various counties and districts in California, Arizona, Colorado, Dakota, Idaho, Nevada, New Mexico. San Francisco Mining Shareholders' Directory. Notices to Correspondents. New Incorporations—List of Officers. New Patents and Inventions. San Francisco Weekly Stock Circular. Stock Prices—Bids and Asks. San Francisco Market Rates. San Francisco Metal Market.

New Process of Engraving.

The plate illustration of Mr. Hallidie's "Rigid Suspension Bridge," for which that gentleman has recently obtained a patent, and which we have placed upon the 9th page of our present issue, is done by a new process of engraving, which has recently been introduced in France, where it is already largely employed in illustrating newspapers and other publications. The illustration which we give to-day is hardly a fair sample of what can be done by this process, it having been executed under all the embarrassments of a first attempt in this city, and upon a plate quite too thin for such work, but the best which could be obtained. Moreover the character of the engraving given, is peculiarly unfavorable for the process. A close, well filled picture is the description of work most suitable therefor.

In this process the design is first drawn upon a lithographic stone, and an impression taken therefrom by use of a peculiar preparation, which takes the place of the ordinary lithographic ink. This lithograph is then "transferred" to a zinc plate, much in the same manner as similar transfers are made upon wood or pottery. This done, by a proper manipulation and the use of an acid to eat away the uncovered portion of the zinc, corresponding to the light which is thrown into the picture, the plate is readily prepared for the printer without the ordinary process of engraving.

This process mainly recommends itself by its cheapness and the dispatch with which a certain class of work can be done. The plate which we have used to-day is the work of Mr. Van de Castele, of the lithographic establishment of Messrs. Britton & Rey, of this city, and, as has already been intimated, is the first work of the kind done on this coast. These gentlemen are making preparations to execute and transfer ornamental designs for window and other glass, the engraving, or more properly, etching, to be done by fluorine acid, after the well known process therefor employed.

NIAGARA SUSPENSION BRIDGE.—The second suspension bridge over the Niagara river is in progress. The wooden towers are erected on each bank, preparatory to stretching the wire. The permanent towers will probably be of iron. The span is 1,300 feet.

Danford's Steam Generator.

FURTHER EXPERIMENTS.

The history of this invention is somewhat familiar to the public, and we have noticed, from time to time, the progress which has been made toward bringing it into practical use; yet as but little has been heard of it for the past year, it may be interesting to our readers to peruse a brief resume of the circumstances which have caused its delay to the present time, and of the continued experiments which have been in progress since our last reference to it.

During the summer of 1865, from a series of careful trials and experiments, extending through several months, it was ascertained, as is claimed by the inventor, and pretty fully demonstrated:

1st. That the Danford Generator would produce a continuous supply of superheated steam from jets of water thrown into a volume of steam; without the boiling of water.

2d. That superheated steam thus generated could be worked at from 100 to 200 pounds pressure, continuously.

3d. That the Generator would do the same work done by the steam boiler, with one-half the coal and one-quarter the water.

4th. That the Generator would in no case explode (even under the highest pressure), being as safe as a cook stove.

The enunciation of these asserted facts startled the world, and well it might, as their demonstration must establish the fact that the Danford Generator must at once become the standard steam power. The most difficult question involved appears to have been that of *durability*—how long would the generator last? As this question could only be settled by continued use, some time must elapse before it could be known what the answer would be.

The generators used in 1865 were made of cast iron, the first one being a sphere two feet and a half in diameter, two inches and a quarter thick, set in a furnace. This generator was in continual use nearly three months, carrying from 100 to 200 pounds of steam to the square inch, operating to the pretty general satisfaction of all who saw it. Then it cracked. It was broken up and carefully examined to ascertain what the condition of the iron was. Fears were entertained that it had burned out, but it was found that the iron was bright and sound, showing not the least appearance of being injured by the fire. Encouraged by this, the inventors were led to believe that the generator had cracked because of its being *too thick*, and arrangements were at once made to have others put into operation in New York city, and at the West, of various thicknesses from three-quarters of an inch to two inches. Pursuing these experiments, twelve were made, of cast iron, and put into operation, consecutively, bringing, as results, the same experience met in the first, namely, that cast iron, however used, of whatever size, shape, or thickness, is liable to crack; so liable that it cannot be depended upon for such a purpose.

The construction and operation of these cast iron generators, cost time and money, and greatly delayed the introduction of the

same to public use. But while the unreliability of cast iron was made apparent, the perfect safety of the generator appears to have been pretty fully demonstrated; some of them having cracked while carrying 300 pounds of steam to the inch, doing no injury, not even blowing the coals out of the furnace! There are many witnesses who can attest the truth of this statement; among them, Judge Wilson, of Kane county, Ill., who came to see one operate. The engine was driven with great energy, under steam of 170 pounds pressure. The Judge was congratulating the inventor upon his grand success, when a dull hissing of steam was heard; smoke and flame being driven out of the furnace door. The Judge remarked that something was wrong, suggesting that the draft must be reversed. He was not a little surprised, when told that he had witnessed an explosion. The generator, in this case, was cracked across the bottom, over twenty inches, the steam escaping into the furnace, without the least damage. On breaking it up, no sign of injury to the iron, by the action of the fire, was found, the thin scale on the outside of the iron not having been burned off.

Trying to patience as were these repeated mishaps, they were no doubt worth, in determining the absolute safety of the new invention, all they cost, of both time and money.

Concurrent with these experiments in cast iron, a generator was made of copper plates, two feet and a half in diameter, quarter inch thick, riveted with a double row of rivets. It was found that this made steam with surprising rapidity and energy, but that it also leaked steam through the joints, after a few days firing, so as to disable it for continued use. Copper being much softer than iron, this experiment should be by no means conclusive against riveted iron, which may yet be found to answer well; although it has not yet been tried.

This experience demonstrated the probable necessity of having generators made of welded wrought iron plates or Bessemer steel. Over three months were spent in visiting iron masters and others who were likely to give the desired information on this subject. As a result of such inquiries, the proprietors of the patent were led to believe that the best wrought iron flange plate could be welded into a generator of any desired size, and that it would prove durable. Accordingly, they had one made at the Atlantic Dock Works, Brooklyn, N. Y., in October, 1866. This was welded up, without joints or rivets, of five-eighths flange plate, Juniatta iron, and was put into operation in November, 1866, which has been in constant use since, sufficiently long to warrant the belief that it will last for years. It is said to generate steam rapidly, and shows no perceptible tendency to burn out, even when the furnace is hottest. Encouraged by these facts, in May, 1867, they ordered some No. 1 charcoal plate flange iron, made by crossing four thin plates of the toughest iron, and welding them together in a suitable charcoal furnace. This plate is then rolled, re-rolled and hammered until it is perfectly sound, making a kind of sub-and-twist iron, of the greatest tenacity and strength. Two generators were welded up of these plates, showing that there is no special difficulty in doing this kind of work. These generators were both put into use and operated with entire satisfaction, giving no trouble, and showing no signs, so far, of burning out.

Difficulties in the way of using superheated steam in the steam engine, it is also claimed, have been entirely overcome. The pump; the regulation of the water; the

valve gear, and the packing about the piston and valve rods; in fact, all the details concerning the generation and use of superheated steam for motive power, are so perfected as to cause the engineer no more trouble than is experienced in the use of the steam boiler. The engine now being usual was made by the Northwestern Manufacturing Co., Chicago, and has Tremain's patent balanced piston valve, which operates without friction, and is most admirably adapted to the use of our steam.

It may be proper here to say something about superheated steam. What is superheated steam? and in what does it differ from other steam?

Superheated steam is known as dry steam, and heretofore has been made only by passing steam, made in a boiler, through a coil of pipes made hot over an extra fire, where it is raised from 300 degrees of heat (the temperature of steam at 75 pounds) to 500 degrees, which is superheated steam. Superheated steam, for motive power, has never been made in any other way, until made in the Danford Generator.

In the generation of steam in the boiler, there intervenes between the fire and steam, a body of water in a state of ebullition, and it is impossible to compel the water to take up but a gradual and limited amount of heat, under the best circumstances; even in the locomotive boiler, steam of but 350 degrees of heat is made; any attempt to exceed this, results in explosion. The whole value of steam for power, is in the heat it contains;—heat is the power; but water is the only substance known through which to distribute this heat and render it effective in the engine. Air has been tried and found to be of little practical value. Ericsson found that he could get but 15 pounds of effective pressure even when he made his generators red hot. Much as we could desire success in this direction, it seems impossible of attainment, air being too light for motive power.

In the Danford Generator, there intervenes between the fire and the steam, no body of water; nothing but the shell of the generator; so that the heat of the furnace acts directly upon the steam, superheating it to the highest degree possible. It is believed that in this generator a limit has been reached to the expansion of water.

The generator now in operation at 248 South Water street, Chicago, it is claimed fully sustains all the pretensions of the inventor. It has a 15-foot fire surface, which, in the steam boiler, represents but one-horse power; yet this generator exerts a 12-horse power, day after day, continuously, and can be worked up to a 15-horse power by urging the fire. The expansion of the steam is such that the engine, which has a cylinder 6x9 inches, cuts off steam at a little over one-fifth stroke, (two inches), making 200 to 250 revolutions a minute, using from 40 to 50 pounds of coal per hour. The furnace is not made with the strictest regard to economy in fuel, as a certain amount of heat is wasted that might be saved in a stationary engine.

The company has made arrangements with E. B. Ward, Esq., of Detroit, (Wyandott Rolling Mills,) for the manufacture of charcoal flange iron for generators, and expect soon to be in a condition to answer orders for engines. Parties on this coast desiring the generator, will do well to communicate with O. M. Taylor, Hicksville, Sacramento county, Cal.

IDAHO FOSSILS.—The Owyhee *Avalanche* of February 8th, says that J. C. Holgate has found, in the neighborhood of Sinker Creek, some curious jaw-bones, which are probably relics of an extinct race of animals. Specimens are to be sent to Prof. Agassiz.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

(Written for the Mining and Scientific Press.)

Diatoms--What they Are, and their Possible Connection with the "Pictured Rocks."

BY PROF. ROWLANDSON, F. G. S. L.

Perhaps it ought to be explained to the reader what diatoms are. This variety of microscopic objects has usually been classed amongst infusoria, and although the researches of our best naturalists have placed these singular organisms in the vegetable kingdom, it is very difficult for an ordinary observer to comprehend such classification. Some varieties possess forms not greatly dissimilar to the *equiseta* (horse tails). Such are the *gallionella sulcata*; while the *eunotia longicornis* and its sub-varieties greatly resemble the appearance presented by a half-grown kidney bean, longitudinally divided through its center. One of the most common shapes is that of a univalve shell, which, in form, would be nearly paralleled by an extremely elongated cowrie—a shell which forms the money standard of value on the coast of Africa. Others, as the bacillarias, approximate in appearance to a bunch of reeds, resembling that primitive musical instrument, Paudean pipes. In fact, the varieties are probably as numerous as are to be found amongst the fungi.

Diatoms have, however, hitherto been placed by naturalists amongst the algae,* rather than the fungi; a comparison with which latter variety of cryptogams would have been unnecessary but for the circumstance that the "pictured rocks" under notice present appearances indicating that the development of the variety of diatoms, if diatoms they be, which have occasioned the singular moss-like appearances which their surfaces present, are more due to a mode of growth, assimilating to that of the fungi, as seen in many varieties of "mold," often so annoying, and sometimes destructive also, when found amongst linen and books, rather than strictly associated with the modes of dissemination and growth observed in infusoria or algae. Viewed in sections, as presented by the slabs now on exhibition, the general outlines more resemble those of mosses or lichens than any other organized matters.

I have been a little diffuse in enumerating some of the above particulars, because it is probably the first time that any public notice has been taken of the possibility that the diatomaceæ may, under certain and favoring conditions, and with certain varieties, develop and extend their species not greatly dissimilar in mode to the species of fungi alluded to, or, in physical outline, to the branching varieties of corals.

The minute organisms now under consideration being, as they most probably are, the typical, if not the actual precursors of every other variety of vegetable and animal life, have been divided into two orders—the diatoms and the desmids; the difference consisting in the former being enclosed in a silicious shield or casing, and the latter in a calcareous one. The remains of the former constitute considerable beds in various parts of California, the Eastern States, and other parts of the world, and when in an unmineralized condition, are employed as a metallic polishing powder. The remains of the latter species are chiefly found amongst the cherty and soluble silicious strata of the chalk formation which is found so abundantly amidst the cretaceous series in England. Dust showers and the so-called blood rains are usually composed of these two organisms, intermixed with protozoans.

I should not have indulged in the preceding speculations had it not been for the circumstance that during a parting visit to relatives, prior to leaving England, who resided in what is called the "Lake District," I, in conformity with a promise given to the late Daniel Sharp, made a geological ramble in the vicinity of Conistone "Old Man," with the object of collecting fossils that might illustrate the geology of that district. While so engaged, I accidentally met a gentleman equally occupied in searching for objects of interest connected with natural history. Amongst other topics arising in the course of conversation, the sub-

ject of diatoms was introduced; and as we were not a mile distant from the spot where I was informed by this accidental acquaintance that a black variety of these microscopic beings could then be seen accumulating, my new friend volunteered to conduct me to one of the small mountain sheets of water, locally denominated tarns, where the phenomenon could be witnessed. On arriving at the embouchure of a mountain stream, and for some distance after the current had become comparatively tranquilized by being absorbed in a considerable body of still water, the entire bottom of the tarn was seen to be covered, and on trial was found to be so in some places to the depth of several inches, with an impalpably fine black sediment, which my companion assured me was composed of the remains of a dark-colored variety of diatomaceæ. Such a deposit would necessarily become occasionally overlaid with sand and other detritus, brought down by the torrents which would succeed rain-storms, and so produce these handed and ribbon-like appearances which are to be seen in the "pictured rocks" now being noticed. A description of the principal facts just described appeared in the journal of one of the London Scientific Societies (either the Microscopic or Geological), and if I remember rightly, some of the forms were figured in accompaniment with the letter-press description.

Only a short time previous to the occurrence just related, I had occasion to descend and examine a copper mine, called the "Green Bank," situated about three miles to the eastward of the tarn alluded to; in descending the shafts of which, especially at the lower portion, I found the walls covered with an exceedingly fine impalpable black powder, very much differing from the mold occasionally seen in deep caves, and sometimes in tin mines, especially when the latter are found in granite. At the bottom of the shaft, and in the older portions of the lowest levels, I found this singular accumulation the most abundant, in some places reaching a thickness of nearly three inches. From the external appearance, I was led to conjecture that this substance might possibly be caused by infiltration and subsequent precipitation of the black oxides of manganese or copper, to either of which the substance bore a strong resemblance; and therefore, for the purpose of future examination, I collected probably as much as would weigh half an ounce, more not being obtained in consequence of its being so bulky. Rough tests, however, subsequently showed that neither of the above named metals was present, on which the remainder was carefully wrapped up and placed with a trunkful of miscellanies of a like kind, with the object of being more carefully scrutinized after my arrival in California. This trunk, however, by some mischance, never arrived, and the circumstances attending the probable origin of this pulverulent matter was forgotten until recalled to my memory after examining the picture rocks now on view.

My attention, on arriving in California, was called to the great accumulation of diatomaceæ in this State, numerous deposits of this character having been described under the common but erroneous title of magnesia; on becoming acquainted with which, my attention was directed towards the possibility that much of our earliest stratified, but subsequently metamorphosed rocks, especially those of a silicious character, were originally formed of similar accumulations. Such a theory will account, in some measure, for the more siliceous character of our lowest stratified and earliest metamorphosed rocks, as compared with their more basic composition of later years; besides, it may be added that a more thermal sea, which, it is highly probable, was also more largely impregnated with soluble silica than the more recent and cooler oceanic waters, would be calculated, if the theory is correct, to greatly promote the development of these minute organisms. The correctness or otherwise of this last named theory is not likely to be solved by direct proof; as, what with aqueous and igneous metamorphic agencies, the excessive divisibility and minuteness of these microscopic organisms, added to the countless ages,—or, as Prof. Owen has termed them, Eons of time,—that have elapsed since these primordial living creatures were called into existence, have, both separately and as a whole, contributed to obliterate all traces of their earliest physical structures. Having suggested the idea, I leave the proof or disproof of the theory to others. Witnessing the dark-colored forms and striae of the "pictured rocks," recalled the recollection of the two instances above detailed, and the whole have been considered in connection, believing it very probable that the varied phenomena described are closely associated.

I had intended to have made some remarks on the probability that ribboned and "mossy agates" may be occasioned in consequence of certain infiltrations and changes which may have taken place with similarly figured accumulations to these now under notice; such observations, however, must remain over to a future day.

(Written for the Mining and Scientific Press.)

Another Letter from Sierra Gordo.

EDITORS PRESS:—If I did not know the Press to be an honest paper, and if Mr. Delavan were not here at this moment, I should be led to suppose that you were following the pernicious example of your contemporaries, and had fabricated your "interesting letter" from "Sierra Gordo" in your little back room at South Beach, where that big cat plays among the chemical bottles.

But I am willing to accept as truth Mr. Delavan's somewhat detailed statement of the number and kind of conveyances which brought him to this place, and took him to that, inasmuch as he is here, and was there, as I am reliably informed. Neither shall I dispute the alleged productiveness of Blind Springs Valley, where doubtless sagebrush, at least, grows luxuriantly. It is also true that Owen's River runs through the valley, without which obliging conduct on the part of that stream, we should all have been drowned during the late heavy rains. But Mr. Delavan's compass must have been out of order, or else he himself was like that ancient mariner, not Coleridge's hut Tom Hood's, who

* * * "A handsome pigtail wore,
And wondered much and sorrowed more,
Because it hung behind him."

And whose "head was turned" in consequence of his frantic efforts to bring the other appendage into the position which he thought it ought to occupy, in front.

Be this as it may, it is certain that the mines in question are not "west of the lake," at least if they are they have effected a very complete change of base since my visit to them last fall.

Mr. Delavan informs the readers of the Press that "the ledges already discovered are very numerous, and there are many more yet to be found." By what witch-hazel or cabalistic communication with the world of spirits, he is enabled to make the latter assertion, we can only conjecture; but, when he says further of the mines, that "some of them contain a large amount of silver, a little lead and copper, and others contain a large amount of lead and considerable silver," and "the mines generally are of that character," we have to thank him for a piece of information the value of which is only exceeded by its precision.

The name of the company with which Mr. D. claims connection, and which has got itself into such bad odor in the mining district that its agents, whether they know it or not, narrowly escaped maltreatment at the hands of the incensed miners, may be "Sierra Gordo" (in this vicinity it is known as the "Squash Co."); but "the ordinary spelling"—"Cerro Gordo"—is not "incorrect."

The name of the district might have been Sierra Gorda, without outraging Spanish grammar, or the feelings of the Academy of Madrid, had its sponsor chosen so to name it; but being probably a modest man, he did not aspire to the honor of naming a whole range of mountains, and so contented himself with calling it Cerro Gordo, or "Fat Mountain,"—an appellation probably suggested by the "fat ore" which he found there, or possibly by the luxurious diet it afforded; as it appears from Mr. D.'s little historical sketch, that he was compelled by hunger to go in search of his two companions, presumably, from the context, with a view to eating them,—in which friendly design, however, he was anticipated by the well known and indefatigable Mr. Lo, who had already "gobbled them up."

How are the two statements, that Mr. D. knows "of no place on the Pacific coast that holds out so great inducements," etc., and that "there will probably be a large emigration here next season," to be reconciled? Does the gentleman mean to hint that it is a good place to go away from?

The furnace which was to be put up, and was to be the means of furnishing much valuable information, turned out a perfect failure, as did also one which was erected near Lone Pine. That there was nothing

in the nature of the ore to justify failure, is proved by the fact that the latter furnace is now in perfectly successful operation, under the direction of a Mexican. Strange that none but Mexicans have yet accomplished any success in metallurgy in this vicinity!

Quite a number of persons have been to see these mines within the last four months, mostly, however, of a character to benefit us but little. I know I speak the sentiments of the miners, when I say they have had quite enough of brainless, pretentious nobodies—spiritual decters, feet-grabbers, and other nuisances, who came here with neither money nor muscle with which to accomplish anything. They want good, solid men, who mean business, and are able to do it, or none. We all believe we have a good mining country. If capitalists choose to come, it will be well; if not, we can do without them. But if they do come, my advice to them is, to study well the character of the particular ores they wish to treat;—to pay, if need be, for competent advice, before rushing to the foundry to order the stereotyped *pan mill*, which Californians seem to think ought to extract dividends from any and every kind of ore.

This valley is sprinkled from end to end with idle and dilapidated *pan mills*, pitiful monuments of the wealth and folly of G. and S. M., or Grand and Sublime Middle-head companies. C. H. A.

Lone Pine, Jan. 18, 1868.

The "Pictured Rocks."

EDITORS MINING AND SCIENTIFIC PRESS: Having observed the comments of your correspondents, and your editorial remarks, in reference to the extraordinary landscape stones that are being exhibited at the corner of Montgomery and California streets, I have also examined them, and beg space in your next issue for the exposition of the following opinions relating thereto:

A first sight impresses the mind that these views are perfect products of vegetable growth, which, by the decomposition of its elements, had been most indelibly marked, by the equivalent: *carbon*, for all time; but such is not corroborated by microscope or analysis,—as I find the former does not expose its vegetal structure, but *crystallization*; and the latter, instead of *carbon*, *peroxide of manganese*, of the variety called "wad," or "hog manganese," which also contains small quantities of other minerals, in constitutional and mechanical forms. It is found deposited in low lands, from decomposition and disintegration of other minerals, more particularly iron, thereby releasing manganese for new affinities. Now, supposing the sand or debris herein, called tripoli, to have been washed or blown to its bed, it would (like all other muds or sands) be distributed unequally, by the irregular action of water and wind, and the other distorting forces of subsequent periods, as exemplified throughout the world's geological field, on all scales, from mountain ranges to the miniature hills and dales of these sections, some of which are cut at oblique angles.

We will now infer that the next wash brought manganese (or deposited mineral sand that by decomposition released manganese), which, in its turn, united with oxygen, and cradled in its sand support, aggregated in "radiated groups of acicular crystals," or in "fibrous botryoidal masses," that would create "*dendritic* (tree-like) *delineations*," which literally and most peculiarly characterize the forms of crystallization of this mineral, and therefore portray and explain the arborescent contour of these formations.

The repetition of this process at different times would form the several stratumnal views, as similarly deposited in all alluvial strata.

This may have been further diversified by the presence of magnetic sand, the tremulous motions of a volcanic region, and by the grains being somewhat soluble, coloring and blending in the margins of crystallization, whilst oxide of iron and carbonate of manganese have tinted the foregrounds.

The comparatively regular distances between the (apparent) trees, may be accounted for by the fact of a single interstice between three or four grains of sand, being insufficient in area for the moving power of crystallization to penetrate; and, consequently, several grains must be packed laterally to make room for extending developments, by the greater closing of several spaces, to increase the one wherein the mineral is deposited. J. S. PHILLIPS, M. E.

Wadsworth House, San Francisco, March 4, 1868.

*Such are the so-called sea-weed, and, amongst fresh water streams and ponds, the long, green hair-like plants so found.

Mechanical.

THE MARTIN STEEL PROCESS.—The *Engineer* has the following: The Martin process was started at Firminy, France, on the 1st of June, 1867, and two Siemens' furnaces have been kept in constant operation since that date, each capable of producing 3,500 kilo. (about 3½ tons) of steel ingots at a charge, two charges being made every twenty-four hours from each of these furnaces. The rate of production at Firminy is therefore about 80 tons of steel per week. The product is cast-steel similar in its nature to crucible steel, or any other kind of cast steel made from raw materials of equal purity and quality. The principle of M. Martin's invention is the substitution of the reverberatory furnace for the crucible, in steel making. He makes the bottom of his furnace to serve as a crucible. He follows a process similar to that in general use by steel-makers, i. e., the melting of cast iron with wrought iron and steel scraps, and with fluxes; and he only modifies his operations to suit the nature of his enlarged crucible. He cannot exclude the furnace gases, as the pot-steel makers do, by covering their crucibles with proper lids; so he employs a quantity of very liquid slag to form a lid, and cover the surface of his metal. He further resorts to the Siemens' furnace, which gives him, in the first instance, a clean flame free from obnoxious impurities, and which, moreover, allows him to adjust the nature and character of the flame from an oxidizing to a neutral and even to a reductive flame, just as the stage of the process requires such changes.

GOOD TOOLS.—The *Artisan* says that great improvements have been made in tools within the last few years. Since the demand for military weapons has declined, the tools and machinery used in their manufacture during the war have been necessarily employed in other work. As the tools, etc., used in the manufacture of fire arms, are of the most perfect description, and as they are mostly constructed with reference to reduplication, the workmen who have got accustomed to them are inclined to follow the same system when they take up work of another description. The milling machine, for instance, is now in use where a few years ago it would have been thought useless. The exactness of its execution induces equal exactness in the other parts of the work. The twist drill, also, is a valuable appliance, which followed the milling machine. A number of ingenious adjustable chucks came next, and even the presence of these drills and nicely finished chucks have a marked influence on the workman who uses them, and the influence extends to the work he is engaged upon. Formerly every mechanic made his own drills and chucks, and any care or labor above the bare requisite in a hastily-made tool was deemed unnecessary, especially if the mechanic was engaged upon "piece-work;" then extra time expended upon his drills or accompanying fixtures was so much deducted, as it were, from his pay or profit, and as a consequence drills and fixtures were slovenly and ill-made, and even this small beginning engendered a carelessness throughout the whole work. The hint may not be lost to the manufacturer who would raise the standard of workmanship in his employes, to furnish them with good tools and fixtures, and the desired result will be effected.

TUNGSTEN STEEL.—The admirable quality of this steel for cutlery has been of late much discussed. At a recent meeting of the Polytechnic Association of the American Institute, Prof. Van der Wyde exhibited a knife, the blade of which was made of tungsten steel. So admirable were the qualities of this blade that it cut glass like a diamond; experiment and examination showed that it did not merely scratch, but made a clean, diamond-like cut. The discussion turned upon Damascus steel, which was declared similar in nature to tungsten steel. Dr. Feuchtwanger stated that tungsten steel was found in this country in Nevada, and a mine had recently been discovered in Missouri. England has also an inexhaustible supply of this mineral. Prof. Joy said that tungsten is more difficult to fuse than manganese. Tungsten derives its name from the German, and means "heavy stone." Two per cent. of tungsten will make iron very hard.

EUROPEAN AND AMERICAN LOCOMOTIVES. A writer in the London *Herald* thus compares the locomotives of different nations:

In England, we see the locomotive engineers, as a general rule, aiming at high speed, as little complication as possible in the parts of the engine, utmost simplicity in all things, perfection of adjustment and workmanship, and high boiler pressure. Franco has slow speed and very heavy trains. Her engineers aim at large tractive force, do not spare complication, use large quantities of material, and couple numbers of driving wheels together. The American idea is cheap engines. Their locomotives have their parts very accessible, and they run them at fair but not high speeds. The American engines have special arrangements for clearing and lighting the road, and for burning wood in their furnaces. American engines are supported on four-wheeled trucks, or bogies, which, while giving steadiness, allows the engine to travel on bad roads, and to traverse sharp curves. The German engines go even slower than the French. The proportions of parts of all the foreign engines—particularly the German—are very bad. For instance, the cranks in many cases have double the quantity of material necessary, and this so disposed as to be a perpetual tumbling weight in their revolutions. Of the Italian lines, we know of nothing special to say. The Belgians run their engines at speeds intermediate between the German and French; and they follow a medium of English and French make in their construction. The Russians are much the same as the Germans. The engines are mostly of English type; in some cases a cross between the English and the American.

BREAKING OF CAR WHEELS.—A writer in the *Railroad Journal* makes the following remarks upon this subject: Anthracite iron, or iron smelted with anthracite coal, from its want of strength,—owing to the sulphur and other impurities in it,—is never used for car wheels. The best charcoal iron should be used. All varieties of hard coal contain more or less sulphur. But the practice of re-melting old car wheels with anthracite coal, using from one-third to two-thirds of new metal, is quite common. With each re-melting, a portion of sulphur is absorbed; and the result is the production of an iron which is growing weaker from year to year. Breakage and loss of life is the consequence.

A BOOK FOR VISIONARIES.—Dr. P. H. Van der Wyde has prepared a work entitled the *Philosopher's Stone*; "being four essays containing the answer of positive science to the question, 'What is known at present about the quadrature of the circle, perpetual motion, the making of gold, and the elixir of life?'" The first, on the quadrature of the circle, is already out; and is spoken of as very thorough. The next, upon perpetual motion, is likely to dispel the dream of more than one enthusiast.

TO POLISH STEEL.—M. Stoss, a German engineer, finds that oxide of chromium is the best substance for polishing steel. The article is easily procured, as it is used for painting on porcelain; or it may be prepared by heating to redness the bi-chromate of potash. The neutral chromate of potash is formed while one equivalent of chromic acid is converted to chromic oxide, which is easily separated.

IRON BUSINESS IN BALTIMORE.—The Abt Co's mills cover ten acres of ground. The eight furnaces of the rail mill have produced at a single turn, 113 tons of finished rails. The total production of the mills is about 25,000 tons per annum, the value of which is two and a half millions of dollars.

THE LATHE.—A new form of the lathe has recently been adopted in Leeds, the arrangement being such that cutting tools can be brought into action simultaneously on the opposite faces and inner surface of the tire, so as to complete the entire operation without shifting the work in the machine.

CHEAP MECHANICAL LABOR.—Wheel stocks 13 inches in diameter are turned from the rough block, bored down the middle for the axle, and mortised to receive twelve spokes, in Woolwich Arsenal (England), at a cost of about 1¼d each.

Scientific Miscellany.

COPPER NOT SO GENERALLY DIFFUSED IN NATURE AS HAS BEEN SUPPOSED.—Jerome Nickles, noticing the remarkable fact that copper has been found by a certain chemist everywhere, and in all substances which he has examined for it, both mineral and organic,—and that, too, while employing reagents which he had carefully tested and found free from that metal, was convinced that there was some source of error,—and that the copper must be derived from the apparatus used. The evaporations and calcinations were performed by the chemist alluded to, in a platinum dish with a Bunsen's burner. These burners are generally of copper. Copper is to some extent volatile when heated in a current of gas; and in fact the flame, when these burners are used, is often seen to be colored blue by the copper which is volatilized.

In his correspondence, dated Nancy, France, Oct. 22d, Nickles says that his remarks upon the subject "have just been confirmed by Lossen, (*Jour. de Pharm. et de Ch., IV, iv 21*), who has found that in fact Bunsen's burner is the true source of the copper that has been discovered in many of the residues from incinerations; for in experimenting with a large number of organic substances, Lossen has, in fact, obtained either some or no copper according as he made his incinerations with a copper, or a glass burner (or one free from copper). Now that this cause of error is found out, many results are explained that appeared strange when they were announced. Of this kind is the grain of copper which Gabn obtained, on reducing to ashes, before the blow-pipe, a piece of paper. The fact of normal copper, that is to say, copper in the blood, may be admitted, if the presence of copper in mineral waters is established. But it is necessary to receive with reserve the assertions with regard to copper-bearing mineral waters, inasmuch as the analysts were not aware of the source of error here mentioned."

TRANSPARENCY OF AIR.—It is well known that clearness of the outline of distant mountains is considered as indicating great dampness in the air, and as one of the surest signs of rain. But this is by no means always the case. The air is equally clear in winter, when it is perfectly dry. De La Rive has concluded that the transparency under the first conditions is due to the absorption, or solution, by the watery vapor, of the impurities which are always mingled with the air. These particles become thereby transparent, and are also rendered heavier, so as to fall to the ground. In winter, the mountains, as seen over plains of snow, are distinctly outlined, although the air is perfectly dry;—because there is no dust. This dust, consisting largely of organic particles, is most abundant in the warm season, when organic life is most active.

A NEW GENUS OF CORALS DISCOVERED IN NEVADA.—The *American Journal of Science and Arts*, for January, contains a preliminary notice, by F. B. Meek, of some fossils sent to him for examination by Prof. Whitney. They are spoken of as presenting an extraordinary and interesting combination of characters. Mr. Meek believes them to be specimens of a new genus of corals, and most probably typical of a new family. In this opinion, Prof. Verrill concurs.

Mr. Meek proposes, for the new genus, the name *Ethmophyllum*. There are apparently two species of this fossil; one large and more robust than the other, and more conical in form. This one is considered the type of the genus; and for it the name *Ethmophyllum Whitneyi* is proposed, in honor of Prof. Whitney. For the other, which is more slender in form, and which also differs somewhat in other respects, the name *Ethmophyllum gracile* is proposed, in case it should prove to be a distinct species.

None of the specimens are quite perfect. They were discovered by Mr. Clayton, at Silver Peak.

BINOCULAR EYE-PIECE FOR HIGH POWERS.

The use of the compound microscope in the examination of minute objects under a very high magnifying power, is exceedingly trying to the eye, when the ordinary eye-piece which admits of the use of one eye only, is employed. H. L. Smith, of Kenyon College, Ohio, describes an eye-piece of his contrivance, by the aid of which both eyes can be used at the same time. It consists of a side tube, through which a portion of the rays from the object are reflected by means of a plate of glass placed diagonally in the main tube. These reflected rays are of course thrown off at an angle from the remainder or transmitted rays which pass through the glass plate (and therefore through the main tube); but are brought back again to a line parallel with these transmitted rays, by means of a small prism placed in the cap of the tube. Thus the observer looks with one eye through the main tube, and with the other through the side tube, the angle formed by them being such that their ends are at the proper distance apart. This distance is adjustable for different persons. The glass plate is made very slightly wedge-shaped as to its thickness,—in order to prevent confusion of images by reflection from its back surface; the duplicate image from such reflection being thus thrown out of the field of view.

Mr. Smith says that this arrangement is not only a great physical relief, but that the effect is decidedly stereoscopic. He does not attempt to explain this fact, although he says that possibly there may be a real, though infinitesimal difference in the two images; and alludes to Mr. Claudet's experiments with the Thaumatrope, which show that the eyes are capable of appreciating a difference in the distance of two objects which are only the one twelve-hundredth of the whole distance apart.

GLACIAL ACTION IN VERMONT.—Edward Hungerford contributes a paper upon this subject to the *American Journal of Science and Arts* for January. He names, in the order of their position, commencing at the north, five peaks belonging to the Green Mountain range, all of which rise to the height of more than 4,000 feet,—which peaks he has carefully examined. He finds decided evidence of glacial action, in grooves and furrows, striations, polished quartz knobs, and rounded cliff-sides. The direction whence the glacial mass approached, is for the most part between N. 20° W., and N. 30° W.; in some cases so varied, according to the conformation of the mountains, as to make it apparent that these mountains presented a partial barrier to its progress,—although the general current maintained its course. Upon Killington Peak, which reaches the height of 4,221 feet above tide water, numerous well-rounded boulders of a rock foreign to that of the neighborhood, were found within twenty feet of the highest point; indicating plainly that they had been raised from a lower elevation and transported from a distance. Mr. Hungerford thus concludes his paper:

"It will be seen from this survey of the elevated peaks of the Green Mountains, that they present in every instance, where an examination has been had, decisive marks of glacial action around their extreme summits. The conclusion follows that those summits have been enveloped by glacial ice, which must have been in each case either the beginning of a glacier descending from the summit, or else a part of an extended ice mass, moving over the entire surrounding country. Against the former supposition might be adduced the form of these mountains, which, in every instance except that of Mount Mansfield, is that of a single isolated peak on which no gathering places for large masses of snow offer themselves; as also the fact that their rounded slopes point uniformly in the case of those I have visited, Mansfield, Camel's Hump, and Killington, to the northward, while abrupt precipices face southward and eastward. Still more conclusive on this point is the presence of quartzite boulders on the summit of Killington Peak, which have had their origin in remote beds at a lower level."

California Academy of Sciences.

REGULAR MEETING.

MONDAY EVENING, March 2, 1868.

Col. Ransom in the chair.
Nathan Porter, Emile Sutter and H. D. A. Schiffer were elected resident members.

THE UTILITY OF BOTANICAL GARDENS.

Prof. Bolander delivered an interesting address concerning the value of botanical gardens. He did not consider the youth of our State and city sufficient excuse for the failure hitherto to do something for experimental agriculture. He instanced what has been done in this direction at Melbourne, Australia, where a public botanical garden is in successful operation which embraces an area of 338 acres, and contains a great variety of forest trees, among which are not less than 10,000 conifers. The experimental ground contains various kinds of cotton, arrow-root, ginger, tobacco, coffee, tea, grass-cloth, and many other useful plants. Foreign and indigenous grasses, hedge plants, and such as are suitable for edgings, are subjected to experiment to test their value. The seeds of no less than 170 grasses have been harvested in the garden and distributed. Of 40,000 stone pines raised at one time, and 7,000 Deodar cedars at another, all were distributed to the public except a few for the use of the Department. A great variety and number of seeds and plants are annually distributed. No less than 209 institutions have been supplied during the past planting season. All vegetable products, whether commercially, medicinally, or technologically important, are eagerly collected and experimented upon. Besides its work in introducing new plants, the Melbourne institution has published many valuable reports, four publications having issued in the past year. The herbarium comprises about 286,000 specimens of Australian and extra-Australian plants. More than 300 genera, either not indicated before or specifically not elucidated, have been for the first time introduced into the systematic vegetation of this part of the globe. Ninety-five of these represent generic types novel to science. The phytochemical department of the institution has experimented with a great variety of vegetable products to test their value as new sources for the employment of labor and capital and the utilization of districts now barren. These experiments have shown that fibers for paper-making, volatile oils, tar, acids and potash, may be profitably produced from many native trees and plants. The report gives facts which show that some portions of the less secluded ranges of Australia, having singular facilities for irrigation, will yield olives, vines, oranges, and an almost endless variety of other fruits.

Considerable discussion followed concerning the utility of plants that have been or may be introduced in California. Dr. Stout observed that he had sent to the Paris Exposition the only perfect specimen of the California snow plant (*Sarcocolla sanguinea*) which ever reached Europe. Mr. Beckwith, the American agent, took charge of and promised to label and describe it; but it was neglected utterly. Another specimen has since been sent by the Doctor to the *Jardins des Plantes*. The plant, if numerous enough, would be valuable for its supply of gallic acid. Drs. Behr and Bolander stated that the snow-plant is unquestionably a parasite, growing from decayed wood on the soil. Dr. Kellogg sent a painting of the plant to Paris eight years ago, when he described it to the Academy of Sciences. Its power of absorption is very remarkable. A drawing of it is found in the Smithsonian publication. Dr. Kellogg lately found a specimen opposite Sitka.

THE GEOLOGICAL SURVEY.

Gregory Yale offered a resolution for the appointment of a committee to prepare a succinct recommendation for the continuance by the Legislature of the Geological Survey. The resolution was adopted after a brief discussion by a unanimous vote. A very strong feeling was manifested in favor of the survey, and of the retention of Prof. Whitney at its head, as a necessity to the material interests, the culture, and the good name of the State, no less than to the general interests of science. The following gentlemen were appointed a committee under the resolution: Gregory Yale, R. E. C. Stearns, Dr. A. B. Stout, H. Gibbons, and John A. Veatch.

The committee above referred to met at the Library Rooms of the Academy, on Tuesday afternoon, and adopted the following resolutions:

Resolved, As the sense of the members of the Academy, that the State Geological Survey should be continued and completed,

as imperative necessity demanded by the material interests of the State, and by the cause of education and science, and as a just exposition of the sentiment of the people of the State.

Resolved, That a copy of the proceedings of the committee be signed by them, and by the presiding officer and Secretary of the meeting of the 2d inst., and forwarded to the delegation of the city and county of San Francisco, to be presented to the Legislature for its action.

Gregory Yale, John A. Veatch,
H. Gibbons, Robt. E. C. Stearns,
Arthur B. Stout, Committee.
LEANDER RANSOM, President *pro tem*.
THEODORE BRADLEY, Rec. Secretary.

New Enterprise.

The North America Wood Preserving Company, which was incorporated in December last, to use the Samuels' process for preserving and indurating wood, have leased for a term of years a large lot on Berry street (Long Bridge), between the San Francisco Fuel Co's works and Fourth street, upon which they will immediately proceed to erect the necessary buildings and machinery for engaging, on the largest scale, in the preparation of wood under that patent.

This process of preserving wood, which has been already fully described in our columns, consists in placing the same in an iron cylinder, which is subsequently filled with steam to be condensed, whereby the cylinder is exhausted of its air. A solution of sulphate of iron is then injected into the cylinder, followed by a solution of lime; the whole being accomplished under a pressure of 175 lbs. to the square inch. By this means the pores of the wood are first emptied of their natural liquids, their place being supplied with the imperishable salts of iron and lime. Wood so preserved is indestructible by the elements, impervious to insects, and will endure almost as long as iron, in any exposure, and much longer when immersed in water. It is, furthermore, attacked with fire only with great difficulty.

The cylinder ordered by the company, which will be built by Messrs. Baurhyte, McAfee & Spiers, is to be 75 feet long by 4½ feet inside diameter; from which it will be seen that the company can prepare the longest piles which are used in our harbor, or the largest pieces of timber employed in any of our architectural works. Boards, and lumber of all descriptions, will be prepared in this manner.

An engine of 16 horse power constitutes a portion of the machinery employed, which will be used in part to run a powerful air pump, which is found necessary to complete the vacuum which has been partially effected by the condensation of steam. This enterprise will be under full headway inside of sixty days, and will no doubt be found one of great importance and utility to this city and the Pacific Coast generally. The additional cost to piles put down and capped in this harbor, prepared by this process, will not exceed 20 per cent.; for ordinary lumber the additional cost will not be far from \$12 per M feet; but when so prepared the durability will be increased tenfold, or more.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

SAN FRANCISCO FARMING AND MANUFACTURING Co.—March 3d. Capital stock, \$200,000; 200 shares, \$1,000 each. Trustees: Daniel Turner, H. J. Davis and J. R. Fitch.

PIONEER HOMESTEAD ASSOCIATION.—Mar. 3d. Capital stock, \$103,000; 216 shares, \$500 each. Trustees: J. W. Parker, W. P. Harrison, Geo. H. Hallett, F. Cyriot, J. Duncan, David Dwyer and Edward Babson.

FUEL COÖPERATIVE UNION.—March 5th. Capital stock, \$20,000; 1,000 shares, \$20 each. Trustees: L. W. Ransom, E. F. Bunnell and H. J. Tilden.

SPECTACLES.—The finest article is to be found at Mullers, Montgomery street, near Bush. Give him a call.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,
March 7, 1868.

City Stocks.

Sales have been limited and the market without animation. A few shares of California Steam Navigation Company stock sold at 75 per cent. North Beach and Mission Railroad obtained \$60 50, and Sutter Street Railroad (preferred) \$18 50. Pacific Insurance realized \$117. The San Francisco Insurance Company holds its annual meeting on the evening of the 17th inst. The opinion is gaining ground that at the annual meeting of the Spring Valley Water Company, on the 17th inst., the stockholders will prefer to levy an assessment rather than increase the capital stock \$2,000,000, as proposed. Virginia and Gold Hill Water Company stock sold at 77½ per cent., or \$93 75 per share, the par value being \$250.

The following is an interesting tabular statement of the indebtedness, etc., of California Counties, as recently reported by the Assembly Committee:

COUNTIES.	County Debits.	Rate of Interest per cent.	Percentage of taxes levied for county purposes.	Assessed Value of real and personal property.	Estimated population of California and Indians.
Alameda.....	\$34,000 00	10	3 07	\$6,670,000	15,430
Alpine.....	10,000 00	6	450,000
Amador.....	32,152 10	10	1 90	2,048,943	11,000
Battle.....	77,515 00	10	1 82	5,128,338	9,350
Calaveras.....	206,240 00	8-10	4 00	1,373,496	10,732
Colusa.....	24,000 00	10	0 84½	2,077,611	3,600
Contra Costa.....	41,000 00	10	1 68	2,673,963	8,000
Del Norte.....	12,000 00	10	1 02	415,289	1,200
El Dorado.....	262,715 11	10	2,331,538	15,000
Fresno.....	19,438 00	10	1 67	1,209,698	3,000

The transactions in real estate were unusually active and important throughout the month of February, 614 sales being effected against 433 in the month of January. In the number of mortgages February shows 252 against 205 in the preceding month, and in releases 188 against 168 for January. These statistics evidence the rage for this kind of property, which many believe is becoming inflated much beyond its real value. In the January sales the amount of purchase money secured by mortgage was \$184,000, and in the February sales no less than \$384,700 were so secured, being an increase of over \$200,000. The remarkable amount of \$2,500,000 changed hands in the same month. There is no doubt that very many purchases have been made for prices much above the real value of the property, and for more than it is likely to pay interest on in several years to come. Rents are already sufficiently high, and it is doubtful whether they can be advanced with safety. The condition of business generally is not active enough, nor sufficiently remunerative to warrant such a move. Cautious men are beginning to hold back a little, and are more inclined to look before they leap. Tying up large sums in lots which will require years to be worth the amounts paid for them, is not exactly the most profitable kind of business, and if persisted in will bring many to grief.

Mining Share Market.

The activity noted for some time past in the mining share market continues unabated, and, as will be seen in another column, the transactions in February exceed those of any other month since the organization of the Board. On Tuesday and Wednesday of this week a decided break manifested itself, but on Thursday prices rallied, and the market has been gaining firmness up to the close of our report. During the period under review, the developments in the various claims have not been very extensive, nor have new points been reached not before noticed. The inclemency of the weather has greatly interfered with the hauling of ores, as well as the forwarding of bullion to this city; however, the present pleasant weather, it is to be hoped, will continue, so that the silver river may resume its wonted activity, and the routes of travel gain greater regularity. During the month of February \$179,734 in bullion was shipped to this city from Wells, Fargo & Co.'s office in Gold Hill, Nevada.

SAVAGE—exhibited greater activity than last week, upwards of 3,000 shares having changed hands at the regular sessions, receding from \$139 to \$163 50, rallying to

\$180, and at the close selling for \$178. Of the 1,001 tons of ore extracted during the week ending February 29th, the north mine, on the third station, contributed 629 tons. The approximate value is given at \$34 94 per ton against \$30 02 in the previous week. A winze from Mason's Spur, on the second station, is said to show ore at a depth of twenty-two feet. The north drift, on the fourth station, still has bunches and streaks of good ore, and the main breasts of the south mine, on the same level, look as well as ever, but the ore from the latter point does not "mill" as well as might be expected from its appearance. In the north drift, on the fifth station, the ore has been followed about twenty feet, and is reported to show some improvement, being of a very good quality. In the south drift, same level, they have reached what appears to be the main ledge, and the quartz is said to be hard and similar to that on the fourth station, showing ore worth \$30 to \$35 per ton. Owing to the bad condition of the roads, ore has accumulated so rapidly that the force in the mine had to be reduced. The receipts, so far, for February account, are stated at \$130,000. The usual dividend will be paid.

IMPERIAL—has been less active, declining from \$255 to \$235, advancing to \$265, and closing at \$267 50. For the month of February, the receipts of bullion foot up \$63,028 07 against \$43,883 in January. The Alta mine continues to yield about 75 tons of ore per day, and the Holmes mine 15 tons. The result of working 46½ tons of ore extracted from the west drift will be reported with the first shipment of bullion of the present month. Drifting will soon be vigorously commenced. The machinery continues to run well.

KENTUCK—was in the market to a moderate extent, opening at \$285½, declining to \$275, rallying to \$290, and at the close realizing \$285. The receipts of bullion for account of February, amount to \$20,422 41.

GOLD HILL QUARTZ—is obtaining a little more notice, selling at \$95½. This is one of the few stocks that did not participate in the recent very marked advance of claims on the Comstock lode. The bullion product of February amounted to about \$5,000. About twenty tons of ore are at present manipulated every twenty-four hours. The prospects for March are considered more favorable.

OVERMAN—sold to a large extent, hitherto at the open and regular sessions, the sales comprising nearly 3,000 shares, falling from \$205 to \$140, improving to \$195, and closing at \$180. Since our last issue, bullion to the amount of \$3,000 has been received at the office in this city. The 361 and 500 levels are reported as showing up change, and the mine, generally, is said to look well.

COLLIER-POTOSI—has been sought for to the usual extent, declining from \$310 to \$189 50, then selling at \$196 seller's, and closing at \$193. The drifts on the 352 station have resulted unsatisfactorily, and work has been suspended in that section of the mine. In the new shaft the west wall is said to grow harder as the work penetrates it. The product of the old mine for the week ending February 27th, amounted to 71 tons of ore against 78 tons the previous week, and during the same time, 200 tons were sent to custom mills against 530 tons in the previous week. No letters have been received for some days.

CROWN POINT—sales have been small at \$1,890 to \$1,825, closing at \$1,865. Work will soon be resumed in the drifts, and operations commenced at the 800 level. The product of the ore on hand and reduced in February yielded \$37,250.

HALE & NONCROSS—a few feet changed hands, for election purposes, at about \$8,000. The annual meeting takes place on the 11th inst. The latest advices from the mine state that the face in the north drift, shows four feet of ore, which will mill \$40 to the ton.

AMADOR—rose to \$255, closing at \$330 h. 30. The bullion receipts for February amount to \$48,000. Recent reports, based upon survey, confirm the richness of this mine. The north level from the Bader shaft is in about ninety feet, showing a ledge four feet wide, and is producing some very fine rock. The south level has attained a distance of thirty-six feet, and in the last ten feet the ledge came in again, showing a width of some six inches. This company has now \$56,000 on hand. A dividend of \$6 per share is payable to-day, and another one of \$4 or \$5 may be expected about the 15th inst.

GOULD & CURRY—continues to be well maintained, advancing from \$640 to \$690, receding to \$595, rallying to \$625, and closing at \$640. The old chambers of this mine continue to produce the usual quantity of ore; the lower levels are full of water.

ALPHA—was in the market at \$1,300 to \$1,250. **YELLOW JACKET** sold at \$1,250 to \$1,145, rose to \$1,255, and closed at \$1,240. **BELCHER** declined from \$285 to \$259, advanced to \$310, and closed at \$300. **OPERA** receded from \$168 to \$147, and closed at \$186. **BULLION** realized \$60½, then \$55, and at the close sold at \$58.

EMPIRE—met with little inquiry, selling at \$250 to \$280. **EXCHEQUER** opened at \$40, declined to \$34, rose to \$46, and closed at \$47. **LADY BRYAN** declined from \$30 to \$19, then sold at \$26, and closed at \$30. **SCORPION** BELCHER receded from \$19 to \$12, rallied to \$20, and closed at \$18 50.

The sales in the Board during the past week have been as follows: Regular sessions, \$1,541,563; open sessions, \$493,011—total, \$2,034,574.

The sales in February show an aggregate of \$9,716,596, being the heaviest amount of transactions since the organization of the Board, and \$1,017,662 in excess of January.

INCOMBUSTIBLE CLOTHING, made so by being saturated with a solution of tungstate of soda, is now the rule among the ballet dancers at the Queen's theater, London.

IRON CASTINGS are bronzed by the Tucker Manufacturing Co., Boston, by coating them with a thin layer of some vegetable oil, and exposing them to a moderate heat.

AN OLD ENGINE—The shops of the Boston and Albany road at Springfield employ about 300 men, and six old engines are under repairs, among them the freight engine "Buffalo," which has been on the road eighteen or twenty years.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Miner, Feb. 22d: The owners of the Sam Booth, Alart, and Esmeralda properties, adjoining the Tarshish ground on Monitor mountain, are working slowly in with the Alpine tunnel. Good ore is occasionally found, but they are not far enough from the surface action of air and water, to expect much yet.

The Lateral tunnel of the Monitor C. M. Co. is getting fast underground. The whole length of this tunnel is now over 55 ft., and in decomposed quartz all the way. Some black sulphurets taken from there this week look well, but whether they are precious or otherwise has not been determined.

Mr. L. Chalmers put a force at work on Wednesday, on his Alpha claim, for the purpose of securing it under the laws of the district.

The Morning Star shaft is now down 100 ft., and is running in as pretty clay casing as one need see.

The Leviathan Co. finding it impossible to prosecute the work of opening their claim as it should be, without additional ventilation, have commenced raising a shaft out.

Chronicle, Feb. 22d: Brown & Kent this week resumed work on the Rippon claim. This company intend pushing work on this claim and satisfy themselves as to its value.

Amador County.

Jackson Ledger, Feb. 29th: Kearsing's mill in this place is now running on the tailings from the Coney & Bigelow mill, and with the Ambler process are saving from 1,000 to 1,500 lbs. of rich sulphurets per day.

J. C. Fall, superintendent of the old Keystone mine and mill at Amador City, is now putting up machinery for saving sulphurets by the Ambler process. The sulphurets from the mine have proved to be very rich—paying \$200 and \$300 per ton.

The Coney & Bigelow mill will soon have 10 additional stamps placed in their mill, making 26 in all.

It is in contemplation by the company owning the Amador mine, to put up machinery and go to work on it in the spring.

Dispatch, Feb. 29th: The company on the McAdams & Hubbard mine, near Jackson, under the title of Casco Co., are prosecuting work with great energy. Their mill and ditch are nearly completed.

Mariposa County.

Gazette, Feb. 29th: Early this week, we paid a visit to the Oaks & Reese mine in Hunter's Valley. Through the kindness of Mr. John Cassell, the Superintendent, we were shown over the premises; had a nice ride in the car down the skip, and as a finale were presented with two fine specimens of gold-bearing ore. The works on this mine, in our judgment, are about the finest in this section of the State.

A company of Chinamen have bought the property of Beach & Co., formerly Mr. Jee's, at Mormon Bar. The buildings will be removed, and the entire flat mined out. The price paid was \$700.

Nevada County.

Transcript, Feb. 27th: It is probable that a larger number of companies are working between the Sugar Loaf and Blue Tent than have been engaged in mining within that range for several years. Several companies are engaged in washing on Selby Hill. They all have abundance of water and seem to be doing well.

Yesterday, we were favored by a gentle falling of the dews of heaven, with indications that it will keep up its lick, so that the snow will be removed and the miners be enabled to resume work.

Feb. 28th: Thales Curtis is engaged in taking down the Redan engine and hoisting works, located near the Ophir mine in Grass Valley township, for the purpose of removing the machinery to Canada Hill in this township. It belongs to Butterworth, Robinson & Co., and is, we understand, to be placed upon a mine near Canada Hill.

Feb. 29th: Wm. Durham offers for sale one-seventh of the Remington Hill ditch, and also several interests in mining property at Chalk Bluff.

March 3d: Very little of the kind of mining which prospers usually during rainy seasons has been done in this county for five or six months. The present season, with its continued and severe storms, has been more disastrous to hydraulic mines than any season that our miners have experienced for many years. For several months there has scarcely been a ditch in the county which was in a condition to carry water; and after they were repaired the cold weather froze up every stream, while snow cover-

ed to the depth of several feet many mining claims. The clearing out of tailings from the beds of creeks, and the deposit of heavy banks of snow as reservoirs from which the miner may draw water late in the summer, are some of the advantages of such a winter as we have just experienced; but these will not pay for the damage to mining claims, and loss of time in consequence of the "heavy wet" and "big freeze."

We saw some fine specimens of quartz from the Pittsburgh mine yesterday. The ledge looks first-rate, the rock is filled with rich sulphurets and shows considerable free gold.

Gazette, Feb. 27th: About four weeks since, a quartz ledge was discovered near Bear river, and about 14 miles from Grass Valley, the rocks taken from the croppings of which exhibited free gold in considerable quantity. The Deeds Co., composed of the original discoverers, have located their claims, and are now engaged in prospecting the same, with good indications of having struck a rich thing.

Feb. 28th: W. H. Rodda, superintendent of the North Star mine, speaks very highly of the Hendy concentrators. The company have eight of the concentrators in operation at the mill, and Rodda says they save 95 per cent. of the sulphurets in the rock crushed.

Feb. 29th: The capital stock of the North Bloomfield Gravel Co. has recently been increased to \$800,000. The water-right of this company is one of the best in the county, and will afford 3,000 inches nearly the whole year. It is expected that the ditch will be commenced early this spring.

Grass Valley *National*, Feb. 28th: We learn that the North Star Co. at French Lead contemplate the erection of works similar to those in operation at the Eureka mine, for obtaining the gold from the sulphurets.

Grass Valley *Union*, Feb. 27th: The town site of Selby Flat, once a lively town, is being washed away by the miners. The houses were torn down before the mining commenced.

The Nevada Foundry is planing some heavy mortars for Crittenden & Co., of French Corral.

Placer County.

Dutch Flat Enquirer, Feb. 29th: The arastras of Messrs. Bakers have been completed and are now in running order.

The Dutch Flat Claim resumed washing on last Thursday. This claim employs 400 inches of water, and seven men.

The Dutch Flat Co. are still actively prospecting for the Blue Lead. Their shaft is being put down at the rate of ten inches per day. Two shifts are employed at present, and it is thought that a third shift will be added very shortly.

Auburn Stars and Stripes, Feb. 27th: The new proprietors of the New Mexico mine have run a tunnel some 30 feet on the ledge, and taken out about 40 tons of rock, which is now being hauled to C. D. Pugh's mill for crushing. In consequence of the wet weather but little is being done by claim owners now, except to "get a good ready" for operations as soon as the winter storms are over.

Grass Valley *National*, Feb. 27th: The longest line of sluices in this State is at Dutch Flat, 416 12-foot sluice boxes, 6 feet wide, and the average yield of each box is said to be \$25 at each clean up, which is once in four months.

Sierra County.

Downieville Messenger, Feb. 29th: It is reported that the Docile Co., of Alleghany, took out last week, in five days' running, 690 ounces of gold.

At Sawpit Flat the American Co. are working twelve men, and are making from \$8 to \$12 per day to the hand. The Buckeye Co. are working 17 men, and are making from \$6 to \$8 per day to the hand. The Union Co. are working 7 men, and are making an average of \$7 per day to the hand. The New York, Eagle and Union companies are taking out pay dirt, but will not be able to wash up until the weather moderates so as to give them water, when they expect big results. Several hydraulic companies will commence operations as soon as water comes. Sawpit will be a lively camp this spring.

Trinity County.

Journal, Feb. 22d: M. J. Fegan has sold his mining claims at Junction City, for \$6,000.

Several hundred feet of iron pipe will be laid in the Carson & Osgood claim; the gravel prospects \$1 to the pan.

The Washington Fluming Co. have their flume nearly completed.

McGillivray's ditch enterprise will be finished by the end of March; 100 men are now at work on it.

Tuolumne County.

Sonora Democrat, Feb. 29th: We have been shown by Mr. Cooper, one of the proprietors, some very rich rock taken from the Garner mine. It was thoroughly im-

pregnated with fine gold; from which fact and the general appearance of the rock, we are satisfied that the mine will pay enormously. The machinery for a 11-stamp mill, entirely of Sonora manufacture, is already on the ground.

But little has been done at Chinese Camp and Montezuma since the flumes which formerly conveyed water to them were blown down. Around Montezuma some mining is being done with natural water. A little to the northeast of Montezuma is a locality called Red Hill, upon which there are many good claims. In fact the hill is all claimed, and the miners are awaiting the action of the Tuolumne Water Co. with regard to introducing a supply of water. We have conversed with several miners who have claims there and found them sanguine of making money, if that all important fluid could be obtained. Between the Montezuma House and Table Mountain there is a large flat which we are informed only lacks water in order to make it give employment and remunerative wages to a great number of miners.

The Tuttletown correspondent writes: Messrs. Dharhour and Superville are erecting a 10-stamp mill on their mammoth vein. They will have it completed and ready to commence crushing some time in June. They intend to amalgamate the tailings from the mill in arastras, such as were in use in the first attempts at quartz mining; they being of the opinion that arastras will save more gold, either free or in sulphurets, than any of the many patents that have come into use to the detriment of the quartz mining interests.

Messrs. Watters and Co. are repairing their mill and will commence crushing from their rich sulphate vein next month.

Mr. Patterson intends repairing his old mill or building a new one some time this summer. His mine has paid regularly for the last twelve years, and from what I have seen it would yield a fortune to its owner if he had a good mill to crush the ore, and arastras enough to amalgamate it.

Pocket mining, as it is called, is conducted successfully in this vicinity.

The Springfield correspondent writes: The "Sultan" quartz mine, of Messrs. Lucas and Paige, near this town, will soon be in full operation. Its owners will erect a 10-stamp mill as soon as the weather settles. It has already yielded \$3,000 by the mortar and pestle process.

Of our Table Mountain claims I will only say a few words, and wish you would come over and take a look at them yourself. Mr. Richards has, by patience, perseverance and the expenditure of a large amount of hard cash, got his mine, the "Joint Stock," in fine working order and will soon employ a large force of men on it.

Messrs. Clark, Robinson and Leversee have re-opened the once famous "Springfield" claim, and are now preparing to erect the necessary machinery for working it. Its prospects are fine, and no doubt is entertained of it being successfully worked.

Yuba County.

Marysville Appeal, March 1st: A box containing rich specimens was received yesterday by W. H. Knight, from the Pennsylvania claim at Brown's Valley, which beats anything in the auriferous line ever received from that locality. This rock came from a new ledge three feet in width, in the north shaft, and 300 feet from the surface, and is the richest we have ever seen from any mine.

ARIZONA.

Prescott Miner, Feb. 8th: Judge Brooks and Mr. Miller, who own and work a claim in the recently discovered gulch, four miles south of Prescott, found a piece of pure, solid gold, weighing \$58.50, allowing \$17 for the ounce. Besides this piece, they took out on the same day, finer gold to the amount of \$19.

Wm. S. Little and Edward G. Taylor have purchased the Excelsior Ditch and Mining property on Lynx Creek. Price paid, \$3,000. Both gentlemen are old California miners, and understand their business.

Geo. Lount is still working his diggings, close to town, and we understand he is getting enough gold to pay him fair wages.

Fred Heury recently informed us that a piece of rock from a ledge which he discovered and located, at Walnut Grove in 1864, which he sent to San Francisco for the purpose of having it assayed, and from which he recently received a return of contents, yielded 53 per cent. of silver, some gold and lead. He says there is plenty of such rock in the ledge.

The upper tunnel in the Eugenie lode, in Big Bug district, is now in 106 ft. The ledge is very thick, and free gold can occasionally be seen in the rock. Geo. E. Berry, last week, sent us three beautiful specimens of sulphuret ore, which he took

out of this ledge. One of them is composed of black diamond-shaped sulphurets, the edges and outside faces of which are covered with very beautiful figures. The sulphuret ore, when roasted, yields plenty of gold.

The placer miners are putting in their biggest licks. Lewis & Thomas was the only company that had cleaned up when our informant, John Garner, left, and he says they got \$10 to the hand. The other companies, also, expect to get good pay.

Messrs. Gray & Kustel are on their way here from California. As soon as they arrive, we opine, Big Bug mining stock will take a rise. The mill will be started to work, and chlorination works will be erected.

Work on the Chase in Hassayampa district is still being carried on. We have not heard, of late, how the lode looks.

Joe Young has hauled three tons of Chance rock to the Sterling mill, which will be worked by Mr. Reed next week. The owners expect to realize largely from this rock.

The Sterling lode is yielding plenty of rich rock.

The Vulture Mining Co. is doing well, getting plenty of rich rock out of both shafts and tunnels.

COLORADO.

Georgetown Miner, Feb. 13th: From present appearances the coming mining season bids fair to rival all previous ones, in the amount of gold and silver hulsion that will be produced. Even at the present time more bullion is being produced than at any time during the past three years. Every stamp mill in Gilpin county that can be made available for the reduction of ore is at work, and those now lying idle for the want of water will start up as soon as the necessary supply can be obtained.

The ore seam in the Wm. Penn lode has widened to five ft. The ore yields over \$500 per ton.

Mr. Minor, at Mill City, recently obtained from one lode near that place, gold at the rate of \$900 per cord.

The adit on the Belmont lode, at East Argentine, is now driven in some 80 ft., and on a fine body of ore all the way.

We saw, at the First National Bank in Denver last week, 1,484 ozs. of silver hulsion, taken from six tons of ore from the Terrible lode. The ore was reduced at the California works, Black Hawk.

Central City *Register*, Feb. 13th: Mining is still going on in the bed of North Clear Creek below Black Hawk, notwithstanding ice and cold.

On the counter of Warren Hussey & Co. might be seen yesterday, 278 ozs. of gold hulsion, worth in currency, \$6,300.

Parties who are working on the Peck & Thomas lode in Gregory district, have struck a large body of beautiful ore. Samples laid on our table yesterday were sulphurets of copper and iron and carry a large amount of gold and silver. It is being worked on shares.

Denver *News*, Feb. 12th: From assays made by Prof. Schirmer, of ore from the Terrible lode, it is shown that the yield of the last ore taken out is \$1,000 per ton of 2,000 lbs.

DACOTAH.

The *Sweetwater Mines* of Feb. 15th, a paper published at Fort Bridger, D. T., has the following items: The King Solomon lode, in Shoshone district, situated on the east bank of Hermit Creek, has a shaft down 20 ft., carrying pay rock the full width of the shaft. Only one wall rock to the ledge has yet been discovered. From surface indications, the ledge is thought to be upwards of 25 ft. in width. Some 25 tons of rock have been raised from the shaft, all of which prospects well.

On the Col. Mann lode, in the same district, a shaft has been sunk to the depth of 30 ft., carrying the foot and hanging walls clear and well defined the entire distance, and showing a vein of 4 ft. in width. The rock is of a uniform character, and prospects well throughout. There are about 40 tons of pay ore on the surface at the mouth of the shaft.

The Summit lode has a shaft down 15 ft., carrying both foot and hanging walls well defined, and an average width of pay rock 5 ft. wide. The ore from this claim, of which there are some 15 tons, prospects uniformly good.

The owners of the Mahomet ledge are vigorously pushing the work of development on their ledge, and have got to the depth of 25 feet in their main shaft, showing well defined foot and hanging walls of slate, and at the lowest depth a vein of good paying ore $4\frac{1}{2}$ ft. in width. Several assays of their rock have been made, giving results from \$25 to \$138 per ton. This result has given great satisfaction to owners, and encouraged them to push the work of opening their claim as rapidly as the weather at

this season of the year will admit of. They have something like 30 tons of milling ore at the surface, which they believe will pay them handsomely for working.

We hear very favorable accounts of the progress made in developing the Atlantic ledge. They have now reached a depth of 45 ft. in the main shaft. At a point 25 ft. from the surface, a cross drift has been run, showing the distance from foot to hanging wall to be 20 ft. 7 in. In the cross cut, a body of excellent ore has been disclosed 19 ft. in width. Several assays of the rock taken from this cut have been made, giving a result ranging from \$20 to \$100 per ton—the average of six assays gave \$68.40 per ton. The pay rock is of a pale red color, and pronounced by all experts to be of the very best quality.

The Reese River *Renville*, of Feb. 20th, gives the following extracts from a letter written by J. W. Menefee at Rock Creek. He says: "My views of this country are not so extravagant as are held by many. There are quite a number of quartz ledges in this belt, and a great many locations have been made; but I don't think one-twentieth part are worth recording. Three or four of the ledges are large and well defined, and can be traced for several miles; and if they prove half as rich by mill working as it is anticipated they will, this will be one of the best mining camps known at present. Our quartz is all gold-bearing. The placer or gulch diggings are very limited, and I think only a few of them will pay. I would advise my friends who are doing anything not to come out this year. At that time the mines will have been proved to a great extent, and if they are good, there will be room enough for thousands."

IDAHO.

Owyhee *Aralanche*, Feb. 15th: During the last five months a vast amount of work has been performed on the Ida Elmore mine. It is now being worked to a depth of 230 ft., where the ore is richer than ever. A drift has been run, connecting the discovery shaft, on what is known as the New York mine, with the main shaft on the Ida Elmore. This was done for the purpose of demonstrating that these two mines are located on one and the same ledge.

Judgo Watson has discovered a new ledge on War Eagle Mountain, at the head of Wehfoot Gulch. It was struck about 250 ft. north of the northern limits of the Poorman, and on a direct line with that mine. We have been shown pieces of rock from the discovery, and it very much resembles Poorman ore.

Fifty men are now at work in the Oro Fino mine. A very rich chimney has recently been struck in the south works, at a depth of 275 ft. from the surface. The ledge varies in width from four to six feet. The Cosmos mill is running night and day on Oro Fino ore.

The Owyhee mill has worked 200 tons of Golden Chariot ore, and Minear's mill is constantly running on the same, both of which have given satisfactory results.

Engines for hoisting will soon be placed on the Poorman, Golden Chariot, Oro Fino and Rising Star mines in Flint district.

Cope & Co. are busy at work on the Potosi. It keeps up its character for richness, and is increasing in width.

The Excelsior mine in Flint has been handed to the Rising Star Co., who have commenced work thereon.

MONTANA.

Helena *Post*, Feb. 15th: We were yesterday shown a handsome gold brick at the banking house of Nowlan & Weary. It is of pure gold, weighs 50 ozs., and is the product of 25 tons of Oro Cache ore, crushed at the Union City mill, Summit district.

Since our last issue, the lead upon the No. 2 shaft in the Oro Cache lode has opened out into a pocket over eight ft. in width.

A. M. Esler, of the Esler Smelting Works at Argenta, brought to town on Monday 1,300 lbs. of lead and 125 lbs. of argentiferous silver, produced from the mines of Argenta, reduced and cupelled at his furnace.

The Mexican known as Jack Thompson, who discovered the Esmeralda, and one or two other rich lodes, has succeeded in unearthing another rich deposit of mineral during the past week. The lode is situated some seven or eight miles from this place, and immediately back of Prickly Pear City. The discoverer has named it the Mexican Eagle, and it has a crevice some 15 ft. wide. Pieces of the rock which had been subjected to fire were covered with globules of gold. Apparently it is one of the richest leads yet discovered in this vicinity.

NEVADA.

Aurora *Union*, Feb. 22d: The mining news from Pine Grove continues to be of the most encouraging nature, and it does not surprise us in the least to hear every

few days of a new gold brick, worth from \$10,000 to \$20,000, being sent out from that place to swell the circulating medium of the world. We have also been informed that a new discovery has been made about three miles southeast of Pine Grove, which promises to equal any discovery yet made in that section.

Virginia *Trespass*, Feb. 20th: Mr. Wheeler and others arrived from Pine Grove yesterday with 1,129 ozs. of bullion, which was the yield of 575 tons of average ore from the Wheeler mine, and worked at the Pioneer mill. Messrs. E. Ruhlberg & Co. assayed the crude bullion, and procured a bar weighing 80 lbs. The assay shows the bar to contain in gold (659.5 fine) \$15,394.38; silver (160 fine), \$233.63—total, \$15,628.01. Considerable copper is also contained in the bar.

PAHRANAGAT.

Reese River *Renville*, Feb. 21st: We mentioned last week that the materials and fixtures for a complete assay office has been sent forward from this city to the district of Pahrangat, where they are to be attached to the 10-stamp mill recently built at Hiko by Benjamin Evans. To-day the fixtures for still another office in that district have been put up at the establishment of J. S. Currie in this city, and will be dispatched immediately. This latter is to be connected with the mill of the Alameda company.

REESE RIVER.

Renville, Feb. 20th: This morning upwards of 4,000 ozs. of crude bullion were brought into this city from Rigby's mill at San Antonio. The bullion is the product of ore from the Liberty mine. Rigby's mill, which was built for prospecting, and is the least in the State, produced largely of bullion in proportion to its capacity.

Mr. J. O'Dougherty, the Superintendent of the Gilligan mine in Egan Cañon, brought into the city a few days ago, 700 ozs. of crude bullion which were produced in the mill by wet crushing and amalgamation. After being melted in the office of David Lundbom that number of ounces yielded a bar valued at \$1,109.65. Of this amount \$675.04 were silver, and \$434.61 gold. The ore which produced this bullion was taken from the depth of 300 ft. in the mine, at which point the ledge is four feet wide. In comparison to the quality of the ore taken from the upper levels of the Gilligan the proportion of gold is largely increased in favor of that procured from the low depth specified. The change is regarded as singular.

The Austin and Belmont Company's stage brought into the city last night the first bullion produced by the mill of the Combination Co. in Silver Bend district. The lot consisted of 14 large bars. Their aggregate value is less than \$10,000. The bullion is very low, the bars ranging from .345 to .639 fine, giving an average fineness of less than .500. Several of the bars are the result of wet crushing and amalgamation, but the major part is the product of roasted ore.

We learned yesterday from Mr. S. M. Beck, of the Belmont Co., that their location upon the El Dorado ledge had improved greatly in appearance. As they attain depth the ledge is less broken, and the occurrence of small strata of excellent mineral is frequent.

Feb. 21st: To-day Boalt & Stetefeldt received 4,618 ozs.; David Lundbom, 3,000 ozs.; and J. R. Murphy 840 ozs. of crude bullion for melting and assay.

The National Bank received last night by the stage from Belmont two bars of bullion from the Belmont Co., and two bars from Hot Creek.

Last night the stage from Belmont brought to the banking house of John A. Paxton & Co. in this city four bars of bullion, valued at \$3,300, from the mill of the Combination Co. It is finer than the first lot, and averages about .550.

Feb. 22d: The mill of the Monte Cristo Co. in White Pine district, will be completed and ready for working in about ten days. They are taking out ore from the Hidden Treasure ledge, which is said to be of a very high grade. There is little or no work done outside of the operations of the company.

The mill of the Twin River Co. in Ophir Cañon, which has been closed several weeks for repairs, was reopened last Monday evening. It will continue to run steadily, until foul weather interrupts the supply of salt, of which article the mill is short.

Feb. 24th: Rock is now being taken from the 400-ft. level in the Florida mine on Lander Hill. One great chunk was brought up in the car, which it nearly filled, that indicated the stratum of good ore to be from 16 to 18 in. thick. There are about 50 tons of ore on the floor.

Six bars of bullion, valued at \$4,000, from the mill of the Combination Company were

brought into the city by stage yesterday. The bullion is still of low grade, averaging about .500 fine.

J. B. Murphy received to-day 2,000 ozs. of crude bullion for melting and assay.

The mill of the Manhattan Co. which was stopped several days for the repair of its main shaft, is again in motion.

Feb. 25th: Within the past two or three days ore of a peculiar quality has been developed in the Diana mine. It is very dark, almost black in color, and resembles somewhat the dark ore found in the Chaso mine near Yankee Blade. The ore is undoubtedly a very rich black sulphuret of silver, and a competent judge has estimated that it will yield in the mill not less than \$1,000 silver per ton.

Feb. 26th: There arrived in the city last night by the mail stage from Belmont, four bars of bullion from the mill of the Combination Co.

To-day J. R. Murphy received 4,000 ozs., and David Lundbom 2,000 ozs. of crude bullion for melting and assay.

Silver Bend *Reporter*, Feb. 22d: The assay office of the Combination Co. commenced melting on the 14th inst. Up to the 21st inst.—the first week—it turned out and shipped bars of refined bullion weighing in the aggregate 1,592 lbs.

For the past two weeks the weather has been quite pleasant, enabling many miners who during the prevalence of the severe cold period of the previous two months have been compelled to keep to their cabins, to again resume operations of development upon their claims. On the older worked mines of the district—El Dorado, Transylvania, Highbridge, Silver Champion, etc., active operations are in progress. The Combination Co.'s steam hoisting works will be completed in two or three weeks, when a larger force can be employed in their mine than at present. A great many other claims are receiving attention and in early spring will be worked with vigor, and probable success.

During the present week Paxton & Co. have shipped 24 bars of bullion weighing 24,213½ ozs., and the Agency of First National Bank five large bars—the weight of which we did not learn.

HUMBOLDT.

Unionville *Register*, Feb. 22d: the Montezuma smelting works shipped this week, 5,824 ounces of fine bullion, making 9,840 ounces from Oreana this month to date. Most of this bullion is over 966 fine.

Atchison proposes to start the Etna mill, for a short trial run on Chloride ore.

The editor has been on a tour of observation to the Arizona and Manitowoc mines. He says of the Arizona: In all our mining experience and observation, we have never seen anything that looks more promising for a certain future, outside of the Comstock. It is not the quantity of ore which makes this mine so attractive, but its value consists in the fact that the ore is a free ore and can be reduced by simple process, and yields more than double the average of the Comstock ore.

Of the Manitowoc he says: A wide space has been staked out at both sides of the tunnel, 40 feet in width at the south end, and extending well toward the mouth of the tunnel. The ledge has averaged about a foot in width as far as taken out. Several hundred tons of ore have been taken from this slope which yielded at the Pioneer mill about \$80 to the ton. But four men are at work in this mine at present, and the same number in the Arizona. This number of men are able to supply the Pioneer mill with all the ore it can crush; but it is in contemplation to put on a larger force early in the spring, to enable the company to have on hand a supply of ore for the new mill to be erected at an early day.

WASHOE.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Feb. 26th: Fox & Co. have jumped, or relocated, the old and once well-known Charles Caney lead, situated southerly from the Caney, and supposed by many to be an extension of the latter. They propose to at once commence operations for the development of the mine.

Feb. 27th: Most of the mills in this vicinity are again in operation.

Feb. 29th: Over three and a half tons (6,797 pounds) of silver bullion were shipped from this city and Gold Hill during the past week, the total value of which was \$165,566.11.

The contractors are again at work taking out ore from the Sacramento mine for reduction at the Mariposa mill, where it is worked for gold alone, there not being a sufficiency of silver contained in the ore to justify working it by the pan or silver pro-

cess. Other companies situated on Cedar Hill in the vicinity of the Sacramento will soon commence operations. During the coming summer there will be work done on almost every mine on Cedar Hill as far north as the Sutor mine, at the foot of the northern slope of the hill, and even perhaps across the cañon as far as M. L. Winn's famous Irving mine.

March 1st: The Rhode Island mill is being thoroughly overhauled and repaired, and will soon be in perfect order in every respect.

About the first of April a party of six or eight men will leave this city for the purpose of exploring a region of country known to one of the number, and lying between the Black Rock country and the Goose Creek mountains; but, as we understand it, some fifty miles north of the Black Rock country, or about as far north as the furthest limits of the Goose Creek range. The mines are supposed to be silver-bearing quartz veins. The man who is to lead the party is a Dane who lived with the Putes for nearly three years, roaming with them back and forth from Pitt River to the Colorado each year. He tells of another rich region to the southward, but thinks that mentioned above the best, most accessible, and best timbered and watered.

The Lady Bryan Co. are at present taking out some excellent ore. They have just struck into a rich streak or deposit that assays \$81 per ton. About the 6th of March they will ship a bar worth \$700, and the 1st of June they expect to declare a dividend of \$5 per share.

Grass Valley *National*, Feb. 23d: While operating at a mill in Silver City, Nevada, a few years since, we run through arastras a quantity of rock from one of the leads near Devil's Gate, the amalgam from which retorted \$12 to the ounce in gold. We now learn that preparations are being made to work the rock from several leads in the same district by the California process. Pans will be discarded, and blankets and copper plates used exclusively, and the mills in all respects arranged after the California style.

NEW MEXICO.

Thos. Richey writes to the Colorado *Herald* concerning the Cimaron mines, under date of Elizabethtown, Jan. 25th, as follows: The mines, as yet discovered, are not very extensive. The principal gulches are Willow, Grouse and Humbug. When I got here I found the whole country claimed. The bedrock is from 20 to 40 ft. deep in Humbug Gulch and the dirt pays from 20 cts. to \$1 a pan, with fine gold at intervals from the surface down to the bedrock. In our claims there is gold from the grass roots down to a depth of 35 ft., and no bedrock as yet struck. It gives about half a cent to the pan, and the gold is similar to what we used to pan out in Mt. Vernon. There is also some coarse gold. One man of my acquaintance has \$300 worth of nuggets, the smallest about the size of a buckshot, and the largest worth \$7. These are from Willow Gulch. There are a number of bars or gradual slopes running up towards the mountains on either side, rich in fine gold, showing to the pan from five to 10 and even 20 colors.

There was not much mining done last summer excepting at the head of Willow Gulch, where they washed a dry ravine and got \$30,000, working from June until the winter set in and the water failed.

There is talk about building a ditch next summer to bring water from Red river, a distance of 40 miles; \$250,000 have already been subscribed for that purpose.

STEAM PLOWING VS. TEAM PLOWING.—A paper recently published in the London *Artisan* by Mr. David Grigg, has the following: The superiority of the spade over the plow remains undisputed, yet the state of the labor market, especially in England, renders such a system of cultivation impracticable. The chief feature of the advantage in spade-husbandry is the thorough loosening and mixing of the soil, and it is assumed that as it can be better done by steam than by manual or horse labor, the result will be far superior to those grown under other systems. This is claimed to be the result of actual experience, as by substituting steam for animal power a marked improvement in the crops, and a much greater yield was the consequence. One reason for the increased productivity is, that a team of four horses, in plowing a twelve inch furrow, will leave more than 300,000 footprints per acre, and as these will nearly cover the ground, the effect will be to leave a hard subsoil beneath the cultivated ground, which becomes worse with every successive plowing.

THERE are fifty-three thousand miles of railway in Europe.

Canvassing Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1868.
Mr. C. T. Ranney is our duly authorized agent for Sacramento County. Nov. 29, 1867.
Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.
Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

San Francisco:

Saturday Morning, March 7, 1868.

Notices to Correspondents.

ONE INTERESTED.—We are not in possession of the motives which induced the Legislature to recently vote the sum of \$500, for the purpose of making a survey of the feasibility of more rapidly promoting the outflow of water from the upper Sacramento, San Joaquin, and the lower portion of the Feather River. If the object sought is simply to remove flood waters, more expeditiously from the upper portions of the various deltas, than is now done, this result can only be accomplished at the expense of the occupiers and owners of land in the central portion of the district. As a case in point, we may mention that, during the last heavy flood, which so nearly inundated Sacramento, had the upper waters of the three rivers named been enabled from additional facilities, to have rushed on to and have arrived at the central valley twenty-four hours before they did so, Sacramento must inevitably have been flooded; as in such an event, the Sacramento River would have risen as high or higher than the American River, and simultaneously with the rise in the latter; whilst, fortunately for the city, as things now exist, the full rise of the Sacramento did not take place until some hours after the rise of the American had obtained its highest limits. During the interval between that occurrence with the two rivers, the American River was enabled to discharge a very large amount of its flood water, whilst little if any could have been discharged had the rise been simultaneous, and none, if the rise of the Sacramento had preceded in time and height that of the American.

ASTRO.—What are called double stars, are certain bodies which from observed changes have usually been deemed to be caused by mutual revolutions round each other. The whole number hitherto observed, amounts to more than 6,000. The proportion of those, the double character of which may be doubtful, has not been determined. The number, however, in which a relative change of position has been clearly detected, amounted at the middle of the present century, to not less than 650.

TEUTON, San Francisco.—Bohemia at one period supplied a considerable amount of tin. Professor Colta has described the tin ore found at Graupen, as existing amongst the grey gneiss of the Erzgebirge, which is traversed by a considerable number of small veins, which average from one to two inches in thickness, but sometimes reaching eighteen inches; the veinstone is principally quartz or greisen (quartz and mica, and sometimes decomposed feldspar).

GOLD CONTRACTS IN CONGRESS.—Leading financiers and bankers have framed a bill to be introduced in Congress, which provides that all contracts for the payment of money which, by the parties thereto, are made payable in gold, shall be deemed to be payable in, and shall be paid, in the gold coins of the United States, according to the tenor of such contracts.

AVAILANCHE AT SIERRA BUTTES.—A Downieville telegram dated March 5th, says a snow-slide occurred the day before at Keystone, killing five men and injuring another. The quartz mill, boarding house and two cabins were considerably injured. The wood-pile split the slide and saved the machinery.

Hallidie's Improved Suspension Bridge.

We illustrate to-day a valuable improvement in suspension bridges—the invention of Mr. A. S. Hallidie, of this city, and patented by him in the United States and European countries.

It is a matter of considerable doubt as to when the first suspension bridge was erected—this form of bridge being probably the most simple contrivance for crossing a stream which a tall tree could not span,—and requiring but a small amount of skill in its primitive construction. Before the Christian era, we find the Chinese had such structures in use for crossing deep and wide chasms; and in the time of the Incas, of Peru, with cables made from rawhide, they were employed for a like purpose there—all, however, constructed as suspension bridges, pure and simple, though bearing but slight resemblance, except in fundamental principle, to the suspension bridge of the present day. Although known and employed from time immemorial, there does not seem to have been any considerable engineering skill brought to bear upon them until quite recently; and, strange as it may appear to those gentlemen so fearful of female innovation, the first record we have of any patented invention bearing directly on the matter, is in the year 1811, when an English lady, named Sarah Guppy, of the city of Bristol, obtained a patent for “the construction of bridges without arches or starlings, by means of metallic chains allowed to hang in suitable curves, for the purpose of supporting a road or pavement of the usual structure, or for railroads.” We leave comment to the interested reader.

Mr. Chas. Bender read a paper on suspension bridges before a late meeting of the Polytechnic Association of the American Institute, in which he made the statement that the first bridge of this kind of which we have any knowledge, was built in America, by a man named Finlay, in 1796, over Jacob's Creek, on the turnpike between Uniontown and Greensburg, Pa.

But it was not until 1820 that a practical application was made on anything like a large scale, when Captain Brown erected the Union Bridge across the river Tweed, having a span of 437 feet; the cables being of bar chain. From this date we trace a number of suspension bridges of various spans, to the last and undoubtedly finest structure of all—the bridge across the Ohio at Cincinnati—having a clear span of 1,057 feet, and built by John A. Roebling, who also erected the railroad bridge at Niagara, of 828 feet span.

Various contrivances have been invented and applied, from time to time, to overcome the flexibility of the cables and roadway of suspension bridges, and to negative or prevent that undulating motion so dangerous to the stability of the structure and so detrimental to the traffic over it.

Dredge's system of suspending bars tangent to the curve proposed to effect this, and many bridges were erected on this plan; but it possessed the fatal fault of too many independent points of suspension, which, in practice, proved to be its weakness.

Roebling has secured considerable rigidity at Niagara by an immense timber truss eighteen feet deep, which a heavy goods train only depresses about four inches, and which would be sufficient for all purposes, if it were not for the expansion and contraction of the cables, making a difference in the deflexion of the curve of over two feet, due to the change of temperature between winter and summer, and which thus destroys, to a considerable extent, the useful effect of the truss.

One can readily understand the difficulties to be met with in effecting rigidity in a suspended roadway that will hold good under all variations of temperature and consequent recurring elevation and depression

of the curve of the bridge cables, or chains, from contraction or expansion, which difficulty, we believe, has never until now been successfully overcome.

This is the most important, although not the only feature, in Mr. Hallidie's invention, and is one which he claims to have successfully accomplished. We accord him the full benefit of his claims, remembering that he has been engaged for many years in the construction of bridges, and that the solving of this knotty problem has had the benefit of his practical experience and observation.

Fig. 1 is a side elevation of the bridge. There are two cables, or chains, on each side of the roadway, that pass from the anchorage in the usual manner over the top of the towers. From the summit of tower, A, Fig. 1, the cable or chain hangs in its natural curve to the lowest point, which is at the base of tower B, and where at point B' it passes under the tower foundation plate and is continued on to the anchorage, as shown by the dotted lines. The second cable on the same side of the bridge passes over tower B, and in the same manner reaches tower A, at point A', passing under it, as shown in the drawing. At point C, being center of span, the two cables or chains intersect, and are, usually secured together, the center suspending rod being attached to both cables. Where wire cables are employed, it is preferred at point A' and B' to attach them by means of keys, or other suitable contrivances for adjustment, to iron or steel connection to the anchorages.

It will be seen in the elevation that the suspending rods are attached alternately to the upper and lower cables. This will be better understood by referring to Fig. 3, which is a longitudinal section of the bridge, showing in detail the arrangement for attaching roadways. A and B, Fig. 3, are the two cables or chains—the first suspending rod, a, (commencing from tower A, Fig. 1) being attached to upper cable A; the second rod, h, is attached to lower cable B; the third rod, c, is attached to upper cable A, and so on until the point of intersection (C, Fig. 1) is reached, at which point the suspending rod is attached to both cables, as before stated. At the lower end of each of these, suspending rods are secured by means of adjustable nuts or keys, steps a', b', c', which receive and sustain lateral girders a'', b'', c'', in the manner shown in Figs. 3 and 4. Resting on and secured to these lateral girders at a point half way between the steps, are transverse girders, m, m, on which the roadway is built in the usual manner. The transverse girders, m, m, being situated half way between the points of support, (a', b', c') transmit the load equally to cables or chains A and B, Fig. 3.

Converging or truss rods connect cables A and B together, in the manner shown in Figs. 1 and 3, and in such a manner as to allow necessary change of deflexion of curve from expansion or contraction of the chains or cables, without affecting rigidity of structure or limit of equilibrium of parts.

It is by means of these converging rods, in connection with the arrangement of the chains and cables together, with the lateral girders, that the inventor claims to secure a rigid bridge, as perfectly rigid as it is possible to make a suspension bridge, and a bridge in every way adapted for long spans and railroad travel—combining simplicity of construction with economy of material.

Fig. 2 shows the plan of bridge with method of arranging cables to prevent side oscillation; the cables being more distant from each other at summit of tower than at the base, and somewhat similar in principle to plan adopted at the Cincinnati bridge.

Referring to general view of bridge, it will be seen that a wave passing over the cables or chains becomes negated on reaching the point of intersection, and that the effect of a wave passing any particular

suspending rod is to raise the rod and one end of the two lateral girders resting thereon to the extent of height of wave,—the two transverse girders, on which the roadway is built, being raised to the extent of only one-half the height of wave, thus reducing it to its minimum effect. No such destructive wave as was stated to have been witnessed at the Brighton Chain Pier, and many other suspension bridges, could possibly accumulate under this arrangement; and it would be impossible to overturn the roadway by means of a gale of wind, as in the case of the Wheeling bridge across the Ohio—the attachment of one end of each cable being at the lowest point of suspended roadway.

In the arrangement of the truss rods, they are attached to the cable at the same point as the suspending rods, and secured by means of bolts. These are so arranged at the lower end as to be capable of adjustment. If these truss rods were continued upwards *ad infinitum*, their points of intersection would be in equilibrium, and form a parabolic curve.

This bridge has been favorably commented on by many engineers of eminence. Patents were not secured in France and England until too late for its admission to the late Exposition in Paris, although the inventor went there himself, partly for that purpose.

The cost of constructing this bridge does not exceed that of the ordinary suspension, while it possesses great advantages in point of safety, rigidity and stability.

Mechanics' Institute Election.

The annual election for officers of the Mechanics' Institute was held on Monday last. Two tickets were in the field, and a most spirited and active contest took place between the friends of the rival candidates, the supporters of both tickets being out in large numbers. Although personal issues were to some extent brought into the contest, the best of feeling prevailed throughout, and the canvass resulted in bringing into the treasury a round aggregate of back dues, most of which might otherwise never have been realized. The large proportion of 717 votes were cast, out of a total membership of about 1,000. The officers elected are especially pledged to economy in the matter of a building and the general management of the forthcoming Fair. The result of the balloting was as follows—all the candidates on the regular ticket being elected:

REGULAR.	President.	MEMBERS'.
A. S. Hallidie.....	416 G. K. Gluyas.....	276
	Vice President.	
J. Wilcox.....	389 A. C. Austin.....	323
	Treasurer.	
H. L. Davis.....	703 Thomas Young.....	13
	Corresponding Secretary.

	Recording Secretary.	
J. T. Holmes.....	389 J. H. Culver.....	328
	Directors.	
N. R. Coleman.....	416 H. Rosekrans.....	311
W. C. Feast.....	406 D. T. Bohen.....	300
N. D. Arnold.....	434 C. H. Harrison.....	293
A. Doble.....	429 James Sellers.....	304
L. Farquharson.....	430 C. L. Tilden.....	307
J. Browning.....	329 Samuel Smith.....	302
John Hancock.....	412 Thomas Graham.....	279

—Mr. Young was not a candidate, he having declined the nomination previous to the election in favor of his friend, Mr. Davis.

INSTALLATION OF OFFICERS.

At a regular meeting of the Institute, held on Thursday evening, the late President, G. K. Gluyas, presented his annual address, giving a brief review of the proceedings of the Association for the past year, and concluding with some timely and pertinent suggestions. It was ordered by the Institute that the address be printed in pamphlet form.

After the reading of the address, the Installing Committee proceeded to install the newly-elected officers, Ira P. Rankin, Esq., officiating as chairman. On concluding the ceremony, he complimented the retiring President, and officially introduced to him Mr. Hallidie as his successor. The retiring President gracefully addressed the Institute, thanking them for the support and kindness which had been extended to him during his term of office. He was followed by Mr. Hallidie in a short and modest address, thanking the members for his election, and expressing his intention to give the Institute his best efforts and attention the coming year.

A New FIBER.—Robert Davidson brought into our office, the other day, several stems of a plant in some respects resembling hemp, which grows in the vicinity of Sinker and Catharine creeks, but with a fiber much finer, and possessing a greater degree of tension than either hemp or flax. The stem is enveloped in a thick covering of this fibrous material, is nearly half an inch in diameter at the bottom, grows to a height of four or five feet, and is surmounted with pods two or three inches in length, inclosing small oblong red seeds, which are winged like those of the dandelion or thistle. It is called silk-weed by some. If some one, possessing leisure and opportunity to experiment in such things, would take the matter in hand, without a doubt its cultivation could be rendered profitable; for we see no reason why a superior article of cordage and cloth of fine texture and durability could not be manufactured from it.—Oryhee Avalanche.

FOUNDRY ACCIDENT.—A singular accident recently occurred at one of the iron foundries in Chester county, Pa. The workmen, after having filled the furnace previous to casting, threw a quantity of iron scraps covered with snow and ice upon the stock, which prevented the escape of the gas generated at the bottom of the furnace, causing it to flow back into the chambers leading to the fan. An explosion was the immediate result. The cast iron fan was shattered, the staples and hinges torn from the door, the windows of the engine room were blown out, the engineer going out through one of them, but without receiving any injury. Nobody was hurt; but the damage done to the foundry was considerable.

Orders received for Buggies, Expresses, and Light and Heavy Thorough-brace. Carriage Springs made to order, 15v15 1am 6m

TELEGRAPH WIRES.—So much trouble has been caused by the frequent coming in contact of wires crossing each other in every direction, as is the case in New York city, and also by the constant lodging upon them of various articles, such as kite tails, old clothes thrown out of upper windows, etc., that it is proposed to do away with the plan altogether, and substitute that of laying the wires underground. It is stated by well-informed English telegraph engineers that, as far as wires running through cities are concerned, the substitution of the underground for the overhead system has proved a great saving in expense as well as trouble. The plan now adopted in London is to draw the wires through cast iron pipes, laid under the foot pavement. The pipes are dipped into tar while hot. Oblong boxes are placed from 50 to 100 yards apart, the covers of which consist of iron frames, into which a piece of flag-stone is fitted, and the wires are drawn into the pipes by means of these boxes. The whole line may be renewed without interrupting communication or digging up the pipes. This plan is, we believe, to be adopted in Chicago.

DIAMONDS IN THE LABORATORY.—A French chemist has made diamonds from carbon in the laboratory, but at a cost of about three times that of the native gems.

Practical Mining and Milling Processes Described.

BEAN'S HISTORY AND DIRECTORY —OF— NEVADA COUNTY, CALIFORNIA.

Editor and Publisher of the Nevada Daily Gazette.

Price, \$5.—For sale at the office of the Mining and Scientific Press, San Francisco. 13v15fr

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

MOSHEIMER'S

Pioneer Mining School,

ASSAY OFFICE

—AND—

Metallurgical Works,

SAN FRANCISCO.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

1.—Assaying of Ores, Metals, and other Mineral Substances.

2.—Metallurgy of Gold, Silver, Copper, Lead, etc., by Smelting, Amalgamating, Lixiviation, etc.

3.—Gold Extraction, by Chlorine Gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.

4.—Concentration.—Dressing of Ores.

5.—Construction of Furnaces, in which any kind of fuel may be used for Smelting, Roasting, etc., as well as the erection of any Machinery or Apparatus required in Metallurgy and Technology.

6.—Technology, or Chemistry as applied to any special branch of Manufacturing.

By my Practical Mode of Teaching, any person of ordinary ability can learn to assay Ores in three lessons, and the working of all the ordinary and refractory ores in a few weeks.

Gentlemen of almost every profession, who, within the last two years have graduated at my establishment, will bear testimony that from my instructions they have learned more in a few weeks than they ever expected to learn.

My charges are from \$50 to \$200.

Ores of every description assayed and worked

THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,
Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises sixteen pages (4 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine builder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS.

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The Mining and Scientific Press is now in its FIFTEENTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1886:

Resolved, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3—in advance. Send for sample copies. Remittances may be made by mail at our risk. If parties sending will register their letters, or send money order.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

SPECIFIC NUMBERS OF THE PRESS and Patent Circulars, sent free.

New Mining Advertisements.

North American Wood Preserving Company.
Location of Works: San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors of said Company, held on the twenty-ninth day of February, 1883, an assessment of two dollars and fifty cents (\$2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 32 New Merchants' Exchange, California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of March, 1883, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-eighth day of April, 1883, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

WM. B. LAKE, Secretary. mar7
Office, 32 Merchants' Exchange.

San Marcial Silver Mining Company.—Location of Works: San Marcial, District of Hermosillo, State of Sonora, Mexico.

Notice is hereby given, that the Annual Meeting of the shareholders of the above named Company, will be held on TUESDAY, the seventeenth day of March, 1883, at 10 o'clock P. M., at the office of the Company, No. 426 Montgomery street, San Francisco, for the election of Trustees to serve for the ensuing year, and for the transaction of other business.

R. N. VAN BRUNT, Secretary. mar7
Office, 426 Montgomery street, San Francisco.

Mining Notices—Continued.

Mining Stock for Sale.

Eight shares reserved stock of the SILVER SPROUT MINING CO. will be sold at cost price, if applied for immediately at the office of the Company, 408 California street.

NATHANIEL PAGE, President.

Chilpancocha Mining Company.—District of Ures, Sonora, Mexico.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-third day of January, 1883, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Certificate.	No. Shares.	Amount.
Bazzolini, D.	11	30	\$150 00
Buzzolini, D.	74	4	20 00
Cheresh, E.	22	5	25 00

WM. SIEVERS, Secretary pro tem.

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. nol10

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

Mount Tenabo Silver Mining Company.—Location of Works: Cortez District, Lander County, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the ninth day of January, 1883, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Certificate.	No. Shares.	Amount.

Lechmann, Chr.	24	12	30 00
Vandervoort, J. C.	28	50	125 00

And in accordance with law, and an order of the Board of Trustees, made on the ninth day of January, 1883, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Maurice Dore & Co., at their salesrooms, No. 327 Montgomery street, San Francisco, on Thursday, the twelfth day of March, 1883, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary. feb22
Office 426 Montgomery street, San Francisco.

Oxford Belt Tunnel and Mining Company.—Esmeralda District and County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of February, 1883, an assessment (No. 25) of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to the Superintendent at the mine.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of March, 1883, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixth day of April, 1883, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

OEO. H. PECK, Secretary. feb16
Office, 212 Clay street, San Francisco.

Nuestra Señora de Guadalupe Silver Mining Company. Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that the Annual Meeting of the Stockholders of the above named Company, will be held on FRIDAY, the sixth day of March, 1883, at 8 o'clock P. M., precisely, to the back room of the basement of N. E. corner Kearny and Bush street. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary. feb29-11
Office, No. 210 Post street, San Francisco.

San Francisco and Castle Dome Mining Company. Location of Works: Castle Dome County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-sixth day of February, 1883, an assessment of ten cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Treasurer, A. I. Gladding, No. 320 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the thirty-first (31st) day of March, 1883, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-first day of April, 1883, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. R. SMITH, Secretary. feb29
Office, Room No. 16 Stevenson's Block, Cor. Montgomery and California streets, San Francisco.

Sacore Gold and Silver Mining Company.—Location of Works: Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of February, 1883, an assessment of fifty cents (50c) per share was levied upon the capital stock of said Company, payable on the eleventh day of February, 1883, to the Secretary, at the office of the Company, Nos. 77 and 78 Montgomery Block, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the sixteenth day of March, 1883, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the fourth day of April, 1883, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. MOORE, Secretary. feb16
Office, Nos. 77 and 78 Montgomery Block, San Francisco, California.

Ventura Gold and Silver Mining Company.—Location of Works: Durango, Mexico.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the eighth day of January, 1883, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Certificate.	No. Shares.	Amount.
C. B. Holm	236	224	\$560 00
M. W. Taggard	312	165	412 50
E. A. Thompson	301	5	12 50
E. Whitling	133	10	25 00
E. Whitling	134	10	25 00
J. L. Whitall	not issued	20	50 00
M. E. Hall	184	2	5 00
M. E. Hall	187	2	5 00
M. E. Hall	304	5	12 50
Miss B. Darrity	196	18	45 00
Mrs D. A. Powers	205	2	5 00
Mrs D. A. Powers	198	2	5 00

And in accordance with law, and an order of the Board of Trustees, made on the eighth day of January, 1883, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, S. W. corner Folson and Stewart street, on the twenty-fourth day of March, 1883, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. W. SCOTT, Secretary. feb29
Office, southwest corner of Stewart and Folson Streets, San Francisco.

Wetch Quicksilver, Silver and Copper Mining Company. Mount Diablo Mining District, Contra Costa County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-second day of January, 1883, an assessment of three dollars (\$3) per share was levied upon the capital stock of said Company, payable on the tenth day of March, 1883, to the Secretary, George Hyles, at his office, Room No. 15 Stevenson House, southwest corner of Montgomery and California streets, San Francisco.

Any stock upon which said assessment shall remain unpaid on the seventeenth day of March, 1883, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular row between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
1st San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO.,
Pacific Iron Works,

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

-BY-

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077
3v13f SAN FRANCISCO.

DR. BEERS' PATENT
WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Placer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of the mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address
Du. J. B. BEERS, San Francisco,
Per Wells, Fargo & Co's Express.

LEFFEL'S

American Double Turbine

THESE WHEELS, UNEQUALED AND UNRIVALED in the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc.

CALIFORNIA REFERENCES.—E. Steaton, Folsom; O. Simmons, Oakland; Mill at Clear Lake; Morgan Coyville, Lexington; Santa Clara County; J. Y. McMillan, Lexington; Santa Clara County. **Send for Circular.**

Agents for California.

310 Washington street, San Francisco

NOTICE TO MERCHANTS
—AND—
MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz. Greater strength; less danger in working, as goods require no slinging or landing; consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any fastening or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

VULCAN IRON WORKS CO.,
By Joseph Moore, President.
JOSEPH MOORE.

HUNGERFORD'S
Improved Concentrators.

MR. HUNGERFORD, having been absent in the interior during the summer months, and engaged in the construction of several Quartz Mills, which have also been supplied with his CONCENTRATORS, has now returned to this city, and is prepared to answer all orders for his Concentrators, which are built either at the Miners' Foundry, in this city, or at Coss & Lombard's, in Sacramento.

Orders addressed to him at this city, by mail or express, will be promptly attended to.
25v15f **MORGAN HUNGERFORD.**

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1.—Or 10 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600
No. 2.—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour.....850
No. 3.—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

EXPLANATION OF THE ABOVE ENGRAVING.
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Expositor Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866.
JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
R. P. JOHNSON,
Sept. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED CERVAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the Improved Cervan Barrel, for a longer term than twelve months. All persons desirous of procuring, without having recourse to legal proceedings, for past infringements, or desirous of receiving Letters of License for the limited period named, are requested to address as below. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

JAMES BRODIE, FOUNDRY AND MACHINE WORKS, OR CHARLES RADCLIFFE,
Express Building, 402 Montgomery street, San Francisco.

WILCOX'S
Patent Steam Water Lifter.

Received First Premiums at the California State Fairs of 1866-7.

Send for Circular.

A Steam Pump without Engine, Piston, Plunger or Buckets, using both the expansive and exhaust power of steam, and doing more work with the same amount of fuel, than any other Pump driven by steam power. It is applicable to either lighter or heavy work, whether for mining, irrigation, or other purposes. It has been used of various capacities, from 500 to 30,000 gallons per hour, and can be made of any size required. It is not injured by sandy or muddy water. In light of lift it is limited only by the strength of the boiler used.
For further information, apply to M. & A. WILCOX, Proprietors, No. 19 Front Street, between 1 and J Sts., Sacramento, Cal. 25v16 2am3m

A NIGHT VIEW OF VESUVIUS.—Bayard Taylor writes thus to the New York Tribune of the eruption, as witnessed by him on New Year's Day, from his window in Naples:

The top of the cone resembled a shallow basin with chipped and cracked edges, and the opening of the crater lay behind it, apparently at some depth. Out of it and around it poured a steady glow, from the stream of lava running over the further side and descending toward the Atrio del Cavallo. But at intervals of not more than half a minute, there were thrown up columnar jets of intensest flame to a height varying from 100 to 200 feet. Volumes of smoke, dull vermilion at first, but soon fading to a dark ash-color, rolled off the leeward side of those fiery pillars, as they rose and whirled away, broadening into the darkness. What seemed to be pure, solid fire, as it issued from the crater, changed into a thousand scarlet sparks, which turned outward on all sides in a sheaf-like form, and showered down again into and beyond the crater. I could roughly estimate the light of the jet by the time which the stones occupied in falling. Some of them were evidently of enormous size.

For hour after hour I watched the explosions, which seemed to threaten an impending catastrophe, yet were as regular and unchanged in their action as wave-beats on the seashore. Indeed, there appeared to be a "ninth wave"—a recurrence, after a number of moderate jets, of one grand, fierce outbreak of oppressed force, hurling its dazzling sparkles against the red cloud which hung directly over the crater. These displays were inexpressibly grand. I have called the color scarlet, but this only expresses its general character. The cone of the shaft was of ruddy gold, and its summit dissolved into fleeting rose-blooms. The darkness of the night—the outline being barely visible against a mass of clouds—intensified the effect.

ANOTHER.—The following letter from Austin, Reese River, to the Territorial Enterprise, shows up another instance of folly: The Rev. Albert Worthington, who deeded a property worth \$10,000 to a plausible fellow bearing the name of Gen. Thomas D. Johns, as a consideration for an interest in certain mining claims in this vicinity has certainly been badly swindled. The locations he bought into are on record and the "holes in the ground" are visible, no one as yet having thought it worth while to relocate them. The Seymour is in the base metal portion of Lander Hill; is opened by an incline to the depth of eighty feet; shows a vein from six to fifteen inches thick, with ore that will yield \$10 to \$50 per ton. It may be the Savage lode, but as it is on another hill and some 1,500 feet off, it would require a mining soothsayer to settle the question. No work has been done on the claim for nearly four years. The Silliman is on Union Hill, above the Whitlatch mine, and has yielded some very fine ore. It is a small vein—three to eight inches wide—and has been pretty well gouged near the surface by chloride ore hunters. It is undeveloped, however, and will require to be opened to the depth probably of 300 feet before anything reliable concerning it can be known—it may possibly one day or other be a good mine. The Great Republic and Camillus are towards the divide on Union Hill between the Manhattan mill and the Whitlatch Union mine. They truly belong to the "wild-cat" family, but some day with extraordinary management might become domesticated. Taking the four ledges collectively, they would possibly realize about five cents a foot, provided a purchaser having \$120—the aggregate price—at command were present at the sale. It will take an outlay of \$20,000 to tell if they are worth anything. I have a word to say to the Rev. Mr. Worthington. If he would not buy an old horse of the value of \$30 without an examination, why should he buy mines without equal precaution—and that too from an entire stranger.

ARTIFICIAL STONE.—In St. Louis there is an establishment for making mantels, etc., from silicate of soda and sand. Flint (silicic acid) and soda are melted together in such proportion as to make a viscid substance. This, mixed with the sand, is ground in a mill and becomes plaster-like putty. It is then pressed into molds by hand. In a few hours it becomes perfectly hard, and is as perfect as the carver's work of months.

VELOCITY OF MUSKET BALLS.—It is ascertained by experiments recently made with targets connected together by electric wires, that the ordinary rifle ball of the Springfield musket, with the regulation quantity of powder, passes over 100 feet directly from the muzzle of the piece in about the fifteenth part of a second.

AN OLD FOOL.—John Bennehoff, a small farmer near Oil Creek, Pennsylvania, whose land happened to be in the oil region, has for three years past been in receipt of a monthly income from oil of from \$30,000 to \$60,000. Being intensely avaricious, and having no faith in banks, he has kept his money in iron safes in his own house, with an armed guard constantly over it. The house was half a mile from any other, with a strip of woods between. About a month ago, a party of men entered at night fall, overpowered the old man and his guard, tied and gagged them, seized the safe keys, opened the safes, and carried off about \$350,000 in greenbacks. Even this lesson has done the old man no good. He still has a large amount of money hidden in his house, and still parades his guard.

IMMENSE FACTORY FOR ARMS.—The new Colt Armory at Hartford is 500 feet long by 60 wide, and is surmounted by a roof frame of wrought iron and a magnificent dome. It is four stories high, has 550 windows, and 37 miles of heating, gas and water pipes. The motive power is furnished by four vertical steam engines.

MODERN TRAVELING SPEED.—The traveler who leaves Edinburgh at 7 p. m. on Monday, arrives at Paris at 6 p. m. on Tuesday, having traveled 679 miles in 23 hours, including a sea trip of 22 miles.

The Photographic Landscape Rock.

The Eighth Wonder of the World!—A Puzzle for Geologists!

On Exhibition at the
S. E. Corner Montgomery and California Sts.

THE EL DORADO PHOTOGRAPHIC LANDSCAPE CO. have on exhibition, at the southeast corner of Montgomery and California streets, a number of LARGE SLABS of the PHOTOGRAPHIC LANDSCAPE ROCK, from the famous quarry at Pleasant Valley, El Dorado County. Some of these slabs are five feet long and three feet wide, and they are PAINTED BY NATURE, IN COLORS, with Landscape Views, which run through the rock, being the same on both sides of the slab, no matter how thick or how thin. These Landscape look as if they were photographs of the adjacent mountain scenery, representing mountain ranges, hills, forests, high rocky points, lakes, caves, sea beaches, and plains. There are also pieces which look like the natural wood.

Geologists acknowledge that nothing has been found elsewhere of the same kind, and they are unable to explain its formation. ADMISSION, 25 CENTS. Open Day and Evening. 8v16-1m

I also manufacture Mechanical Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done. 8v13-1y Stove Store, No. 125 Clay street, below Davis.

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION!
The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, proceed, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Up-right Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. BLAKE & TYLER, 14v14-1f Agents for the Pacific Coast.

The attention of those afflicted with any disease of the eyes, is directed to the advertisement in this paper of Dr. D. R. Morgan, oculist. Dr. Morgan has just received a patent through the Agency of the MINING AND SCIENTIFIC PRESS, for a lotion or wash for sore or inflamed eyes, and from the character of the recommendations which he furnishes to the public, we would judge that he is having more than usual success in his treatment of diseased eyes. The Doctor is a thorough gentleman, and has practiced his profession for fourteen years on this coast, and is therefore fully acquainted with the eye diseases incident to our climate.

ANOTHER CALIFORNIA ENTERPRISE.—A Factory has been started in this city for the manufacture of AUSTIN'S CELEBRATED BRILLIANT PASTE BLACKING. This preparation not only produces a most brilliant polish; but, unlike imported Blacking, it is pronounced the best LEATHER PRESERVATIVE ever introduced. Trades supplied twenty percent less than any imported article. Factory, No. 1 Montgomery Court, near the corner of Broadway. 26v15-3m

MEDICAL AUTHORITIES have announced that not less than ONE-FIFTH of the entire population of the United States are afflicted with Neuralgia in some form. Surely the man who can safely remove such a vast aggregate of pain is a great public benefactor. Such is Dr. Turner, of Boston, in Mas' sachusetts. His "Universal Neuralgia Pill" is pronounced on all hands, to be an entirely harmless and perfectly certain remedy for this most torturing of all known diseases. See advertisement in another column.

DISEASES OF THE EYE.—During a late visit to San Francisco, we fell in with an old acquaintance from this county, Mr. O. W. Purdy, who formerly resided at Forrest City. About two years ago, while under treatment, we saw Mr. Purdy at the office of an oculist in that city, with eyes badly inflamed and the sight entirely lost. We saw him a few months later at another physician's, but his case was scarcely improved, and seemingly hopeless. His eyes have now entirely recovered, so that he goes about his ordinary business. From his own lips we learned that the restoration of his sight was entirely due to Dr. D. R. Morgan, whose office is at No. 627 Sacramento street, between Montgomery and Kearny, who cured him in the short space of eighteen weeks. Mr. Purdy mentioned several remarkable cures which occurred in the practice of Dr. Morgan during the time he was under treatment, among which was that of Mrs. Jane Albert, of Brownsville, Yuba County, and several others. Mrs. Albert had been afflicted with sore eyes from early childhood, and for eleven months previous to treatment she had not been able to discern light, nor had she seen the features of her youngest child, twelve months old. She had heard of the remarkable cure of Leonard P. Eder, of Marysville, and Joseph E. Haskell, of Sacramento, and determined to try Dr. Morgan. The result was that she was able, after ten days, to read ordinary newspaper print. Mr. Purdy was of course greatly rejoiced in the recovery of his sight, after so many trials and failures with different physicians.

HENDY'S LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators or pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:
FIRST—In setting up, set the pan, A, level by the inner rim, near its center.
SECOND—While in operation, keep the Pan, A, about half full of sulphurets.
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL. (7 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (6 Concentrators).....	Grass Valley, Nevada County.
NORRIDGEWOCK MILL. (2 Concentrators).....	Grass Valley, Nevada County.
VALENTINE & CO., Commercial Mill (3 Concentrators).....	Nevada County.
HUMBOLDT CANAL CO. (1 Concentrator).....	Humboldt County, Nevada.
ROBINSON & McALLISTER M. & M. CO. (3 Concentrators) Hunter's Valley, Mariposa County.	
PLYMOUTH ROCK MILL CO. (2 Concentrators).....	Calaveras County.
MIDAS MILL CO. (4 Concentrators).....	Virginia, Montana.
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....	Virginia City, Nevada.
VULTURE CO. (8 Concentrators).....	Prescott, Arizona.
NOYES & CO'S MILL. (2 Concentrators).....	Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....	Owyhee District, Idaho.
MOREY & SPERRY (1 Concentrator).....	New York.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Sinaloa, Mexico.
EL TASTE CO. (2 Concentrators).....	Sonora, Mexico.
B. F. BROWN (1 Concentrator).....	Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.

J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. Co.,
VIRGINIA CITY, Nev., Sept. 17, 1867.

JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco.

Yours, very truly,
LOUIS JANIN, Jr.
The bill was presented in accordance with the above request, and duly paid.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

The State University Bill.

We have received and read a copy of the Bill introduced in the Assembly, by Mr. Dwinslle, for the establishment of a State University, to be known as the "University of California," and to be located at Oakland. The bill has evidently been drawn with great care, and appears to embody all which the past experience of other similar institutions can suggest. It provides for a College of Agriculture, a College of Mechanic Arts, a College of Mines, a College of Civil Engineering, and such other Colleges of Arts as the Board of Regents may determine. In short, the University has for its design, to provide instruction and thorough and complete education in all the departments of science, literature and art, industrial and professional pursuits, and general education.

The College is to be founded upon the magnificent donation proposed to be made to the State by the present College of California, which will disincorporate as soon as the State University is established, and turn over thereto all its property and good will. Provision is also made by which other colleges now or hereafter established, may be affiliated with the University, so that students can be received from them, and upon examination, degrees conferred for proficiency in either general or special branches of learning. But colleges so affiliated may retain their own property, while the President of the University is to be a member *ex-officio* of the faculties of all such affiliated colleges. In this way any college can have a relation to the University, while it is left to manage its own affairs, so far as its separate existence is concerned. The University is to open its doors as wide as possible to every youth who wants more education than the Common School can afford. The bill is entirely free from provincialism, or sectarianism. It is cosmopolitan, and liberal in all its provisions. The government of the University is to be conducted by a Board of Regents, which is to consist of 22 members, and to include the Governor of the State, Lieutenant-Governor, Speaker of the Assembly, the State Superintendent of Public Instruction, the President of the State Agricultural Society, and the President of the Mechanics' Institute of this city.

Eight other members are to be nominated by the Governor, and eight additional honorary members are to be chosen by the appointed members.

If we were allowed to make a suggestion in this connection, it would be that the President of the Chamber of Commerce of this city, should also be made an *ex-officio* member of the Board; especially inasmuch as a mercantile education will undoubtedly be provided for on the broad educational foundation contemplated in this University. It is to the merchants of San Francisco that its founders must look, in a large degree, for material aid in carrying forward this truly great and liberal enterprise.

A liberal and practical education of all our industrious classes is what is desired for California. Our aim should be to as-

Behren's Patent Rotary Pump.

In our issue of Feb. 29th, we illustrated and described a new rotary engine recently patented by Henry J. Behrus, of New York city; and in that description mentioned that the engine, by having power applied to it externally, might be used as a pump. The illustration which we then promised to give, showing its adaptation for pumping, is now presented. It will be seen that the invention consists of an engine and pump, both attached to the same bed-plate, both constructed after the same pattern, and both operating upon the same principle; the cylinder seen upon the right being the engine, and that upon the left the pump. Steam is conducted to the pistons of the engine by the vertical pipe seen in the center of the engraving, and is admitted to the

ment of the cylinders of both pump and engine are precisely the same as the detailed cuts given in the description of the engine in our issue of the 29th ult., with the exception that as the induction of steam is at the bottom of the cylinder and the eduction from the top, the manner of the working of the engine is the opposite of the description there given.

It is not necessary that the engine represented should be used to drive the pump, as any ready motive power may be substituted in place of this engine, the propelling force being communicated to either one or the other of the pump piston-shafts, or a hand wheel may be substituted as a driving wheel, in place of the fly-wheel represented.

This pump is said to be economical for operation and certain and effectual in its results, and for use in breweries and sugar refineries is especially adapted. It will pump hot beer, thick mash, cold molasses or water with equal facility.

The patent upon this pump is the same as upon the engine, and was issued April 10th, 1866, and first illustrated and described in the *American Artisan* of March 13th, 1867.

BEHREN'S PATENT ROTARY PUMP.

cure for all who desire it an education, not merely in the strict line of their pursuits, but also in such branches as constitute the popular idea of a "liberal education." Let our industrial classes have the fullest possible opportunities to become acquainted with the natural sciences; enlighten their minds with a knowledge of history and literature, and society will thereby be greatly elevated and improved. A people thus educated will exhibit in the ordinary details of their business, a practical application of what they have learned, and cannot fail to place their State far in advance of any community where less attention is paid to properly fitting its young men for the struggle of life in this highly enlightened and eminently progressive age of the world. We earnestly hope that all our legislators will take the same enlightened view of this matter, which has been evinced by the author of the Bill under consideration.

THE TIDE LAND BILL.—The Railroad Tide Land Bill, which grants 1,780 acres of the most valuable portion of the southern frontage of the city to the Pacific Railroad companies, even if it should be restricted to the lands north of Hunter's Point, has been laid over by the Senate to Wednesday next.

pistons at an opening at the under side of the cylinder, exerts its force upon the pistons and is exhausted by the vertical pipe seen in the right of the cut extending from the top of the cylinder.

Upon the bed-plate opposite to the engine is placed the pump, and in its construction is precisely the same as the engine by which it is driven. Continuous from the shafts of the two pistons of the engine are the two shafts of the pump, and the same pair of gear wheels that are necessary for the continuous revolution of the engine are placed midway between the two cylinders, and are also the necessary auxiliaries to the continuous rotation of the pump. The mouth of the suction pipe, to which the necessary continuations of pipes are made to reach the liquid to be drawn, is seen underneath the cylinder of the pump, and the ejection pipe, through which the liquid is forced, extends from the top of the pump cylinder and may be conducted wherever the liquid is to be discharged. A light fly-wheel is placed upon one end of one of the piston-shafts for the purpose of assisting in the first start of the pump or engine, if such assistance is needed.

The internal construction and arrange-

TURNING A MOVABLE WHEEL AROUND A FIXED WHEEL.—The question,—"How many revolutions, upon its own axis, will a wheel make in rolling once around a fixed wheel of the same size?"—has been discussed in the *Scientific American*. That journal having answered "one," a correspondent sent to it a communication with a diagram, taking the ground that the answer should be "two." The *Scientific American* dissents, and still adheres to "one,"—furthermore insisting that the correspondent proves himself wrong by his own diagram.

Now to our mind, the aforesaid Philadelphia communication by "L. M." is conclusive, and the accompanying diagram rather neat than otherwise. Our readers may easily demonstrate for themselves that the *Scientific American* is wrong. Take a common bottle cork. From one end cut two slices one-eighth of an inch thick. These disks of cork will serve for the two wheels. With two pins, fasten one upon the table for the fixed wheel. A pin through the centre of the other will serve as its axis. Before putting in this pin, pass it through another bit of cork. Let this bit be a little above the disk, so that it shall not revolve with it. Make a dot, with ink, upon it, and opposite this dot, another upon the disk. Make a small cross upon each disk, at the point where they touch. Now taking firm hold of the pin which serves as the axis of this wheel which is to be moved, make the said wheel roll around the other—carefully, so that it may not slip. If you watch the two dots aforesaid, you will find that they meet twice, while the crosses meet once; that is to say, the moving wheel revolves twice upon its axis in making a single revolution around the fixed wheel. *Quod erat demonstrandum.*

Questions for the Scientific American and its Friends.—Does the moon revolve on its own axis? If it does—how often?

JEIGH ARRH.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

(Written for the Mining and Scientific Press.)

British Educational Mining Institutions.

BY PROF. ROWLANDSON, F. G. S. L.

NUMBER TWO.

With respect to the minor or provincial educational mining establishments existing in various parts of Britain, the first in order as being the oldest, is the School of Mines at Truro, the county seat of Cornwall. In fact, as early as 1838, Sir Charles Lemon then, and who I believe still continues to be one of the parliamentary representatives of this, his native county, established at his own cost, a mining school, owing to his being so anxious to exhibit the importance of such an establishment. This school was continued for about three years, on which Sir Charles offered to place at the disposal of the county the sum of \$50,000, if it would add a like sum for the purpose of founding a proper school of mines in Cornwall. From causes now unnecessary to name, the object was not then carried out. On, however, the opening of the Royal School of Mines, an impetus was again given to the subject in this important and well known mining county, and a local school of mines was soon after established at Truro, which still exists, and has been found of great use in creating a new and more intelligent class of mining officials.

It may not be out of place to give here an instance which we now have amongst us, showing the advantages obtainable from such institutions, even when conducted not under the most favorable auspices in a pecuniary point of view. Mr. J. S. Phillips, a most intelligent and experienced mining engineer and metallurgist, who has recently come to reside amongst us, has informed me that he obtained his normal instruction in the sciences associated with mining, at the school conducted under the pecuniary patronage of Sir Charles Lemon, previously noticed, which School was superintended by his brother, John Phillips; the chemical class being then taught by Mr. Robert Hunt, the present keeper of the Mining Records at the Royal School of Mines.

The next, I believe, in time, was the formation of the School of Mines at Sheffield, Yorkshire. This school is perhaps the most numerous attended by pupils of any similar institution in Britain. It is situated centrally amidst a most important coal and iron region, whilst the manufacturing of steel, metallic vessels, comprising those formed of copper, gold, silver, etc., etc., or of alloyed materials, as pewter, German silver, britannia metal, etc., plated and electro-plated ware, are also simultaneously carried on at Sheffield more extensively, probably, than at any other place in the world, Birmingham probably excepted, so far as a few articles are concerned. The body of teachers at this school is of a first class character, and here as a whole, especially when it is kept in remembrance what great local advantages exist for the pupils acquiring practical metallurgical and general technological knowledge at the numerous workshops of varied character which surround them; perhaps no school in the world affords to the impecunious but zealous mining and metallurgical student so many opportunities for improving himself at so small a cost. Here every favorable opportunity occurs for acquiring all branches of the studies associated with mining and metallurgy, and any student of ordinary mental acquirements, accompanied by industry, can here easily fit himself for the highest position which the professions of mining and metallurgy can offer.

The Normal School of Mines at Swansea is another institution which is doing a large amount of good in diffusing mining and metallurgical knowledge. Like Sheffield, this town presents some favorable opportunities for witnessing and consequently of studying, the reduction of copper, lead, zinc, gold and silver ores.

Besides the above named schools established chiefly for the purpose of spreading knowledge more particularly in connection

with metallic mining, numerous associations are to be formed amidst the various coal fields, either as local schools or societies, such as to be found in the Northern coal field at Newcastle upon Tyne, also at the Forest of Dean in Gloucestershire, and at Bristol, and I believe at Glasgow one exists, though the metallic mining institution was some time ago closed, owing to deficiency in patronage.

In promoting and diffusing sound information on subjects intimately associated with mining, not only for the benefit of the British Dominions, but as adding to the general stock of human knowledge, and so calculated to benefit all mankind, the London Geological Society and Kensington Museum, ought not to be forgotten, nor the numerous aids and information obtained by the assistance of local geological societies, such for example, as those of Manchester and Newcastle upon Tyne; also the Polytechnic Society of Cornwall, with the Truro and Penzance Museums of Cornwall. In this connection the magnificently colored maps and sections published by the geological survey ought not to be omitted, as their publication has greatly contributed towards the diffusion of a general taste for geology throughout all classes in the slightest degree educated, and more practically made them better acquainted with the economical advantages derivable by their great mining and metallurgical interests, by assisting and promoting such institutions as have thus been cursorily noticed, and a survey of the character just glanced at.

The preceding was set up before I perceived that I had omitted any notice of the Royal Geological Society of Cornwall, which society has published several volumes of transactions, since its institution in 1814, forming a most interesting series, the last volume promised, and which is now probably published, was announced some time ago. It will undoubtedly be a most interesting one to practical miners, as it was promised to be composed solely of statistics and descriptions relating to mining.

Letter from Central Nevada.

BY AN OLD CORRESPONDENT.

MESSRS. EDITORS: It is now many months since I have sent you anything for the columns of the PRESS. During the last twelve months, we have been making substantial progress in developing the resources of this portion of the Silver State. Several of the small veins of Lander Hill, are now opened to the depth of from 300 to 500 feet, and it is considered, as an established fact, that they are not only permanent, but increase slowly in size and richness as a greater depth is attained. The mines of the Manhattan Co., which a year ago were in some quarters thought of little value, have since that time yielded \$600,000 in bullion. Even now, they cannot be said to be opened, though paying handsome dividends to the stockholders. The Florida mine, for the same time has yielded \$160,000 in bullion—its incline being 450 feet deep. The company which owns this lode, has the intention of penetrating the center of Lander Hill, by two shafts, each a thousand feet deep; one of these, the Sherman shaft, is now down some 250 feet, and the other, the Burns' shaft, 150 feet.

The Murphy mine, Twin River District, is proving to be a very valuable property. Its actual yield of bullion from 109 tons of ore, the last quarter of 1867, as proven by the Assessor's returns, was \$144,950, being at the rate of \$132.86 per ton. The mines at Silver Bend have been opening well. The El Dorado south has four feet of ore which by a working test of 18 tons, gave a pulp assay of over \$200. The Highbridge mine of the Combination Co., has yielded a large amount of big grade ore. Its value, however, is not yet known. Ten days ago the mill went into operation with 40 stamps, and although working on the poorest ores, \$13,000 in bullion has already been shipped. The grade, at first, as is usually the case in new mills, was low; but as the furnace gets the right beat, this will be overcome.

Considerable prospecting has been done in Hot Creek, Reveille, Morey and Danville districts, but nothing permanently reliable has as yet been developed, although the prospects are of the most promising kind. The mill of the Century Co., at Newark, 90 miles east of Austin, was doing excel-

lent work, when compelled to shut down for want of salt—the clean up being about \$1,000 a day. The mines of the company are proving to be good—the principal vein in the lowest level, being eight feet wide, of ore, which in the mill, gives a pulp assay of \$100.

Farther east, 150 miles from Austin, the mines of the Social & Steptoe Co. are giving most encouraging results. Down 400 feet, the ore is \$60 to \$80 grade, with large quantities at command. A first-class 20-stamp mill is about to be built on this property. At no previous time have our prospects looked so well as they do now. We have mines of undoubted value, and when the railroad has brought us cheap labor, and generally reduced all our expenses, many of the mines which cannot be worked now, will become very valuable to their owners.

UNDEVELOPED MINES.

I can only allude to one mining section in this letter. About 140 miles southwest of Austin, is situated Columbus District, about which very little has been known hitherto, mainly because the mines were in the hands of poor men, without influence. The Northern Belle lode, is either one of the greatest mines ever discovered in the State, or it is an absolute "bilk." It is a massive vein 15 to 20 feet wide, showing for 700 feet a quality of rusty chloride-looking ore, which, at first sight, one would think of no value whatever. Assays, however, prove even the worst looking of this ore, to contain from \$60 up to \$150 per ton. A hatch or two washed in the Knickerbocker mill, in Union District, gave a pulp assay of \$123. The conclusion arrived at by the tests recently made, is, that the Northern Belle has thousands of tons of milling ore, and is a property of inestimable value. Scarcely any development work has been done, but sooner or later some wealthy company will be far-seeing enough to get hold of this mine, and then Columbus will come into very prominent notice, as a bullion yielding region. The country around the mines is of the most uninviting character; great plains of alkali extending on all sides. It is healthy, however, and has sufficient water for several large mills, and wood in abundance, some ten miles off. If the Northern Belle is half as good as is generally supposed by experienced miners, all the disadvantages of the section will be more than counterbalanced. There are several other mines of fair promise in the district, but none of them have been opened enough to prove their reliability.

J. D. E.

(Written for the Mining and Scientific Press.)

The "Pictured Rocks."

BY PROF. ROWLANDSON, F. G. S. L.

Mr. J. S. Phillips, having analyzed the pictured or landscape rocks now on exhibition, considers that the dark striae and black moss-like outlines, are chiefly composed of manganese; such may be the case, either wholly or partially, and still be far from invalidating the theory that the appearances under notice have been formed by diatoms or protozoans, the former being the more probable supposition. I have in my last paper, shown that diatoms of a black color continue under favorable conditions to flourish up to the present day. What may be the origin of this deep black color in this variety of diatoms, I am not prepared to state, for it needs not necessarily be caused by carbon, for it has to be borne in recollection that the proportion of carbon in the diatomaceae is exceedingly small; the bulk of these organisms being chiefly composed of silica and water. In fact, I have never yet learned of any, even approximative attempt, having been made towards an estimation of the proportion of carbon existing in diatoms.

Ignorant of such proportions, and from inductive reasoning, and analogy, being led to believe that organic matter cannot be formed without the presence of carbon; which is so well understood to be the case, that organic chemistry has not uncommonly been termed the chemistry of carbon; yet I am disposed to believe that in these primordial organisms, the proportion of carbon is exceedingly small. Small, however, as such proportions may be, its presence would be able, to a limited extent, to reduce various salts and oxides from soluble into insoluble

forms, in cases where such have been brought into contact with any carbon resulting from preëxisting organisms. We do not, however, depend wholly upon carbon in order to establish the fact that these organisms can be metamorphosed wholly or partially into metallic oxides. The glauconite or green grains found in the cretaceous formation, the presence of which, in certain rocks has obtained for them the denomination of green sands, are proof that silica can, under certain conditions, be replaced by oxide of iron.

Banded and fortification agates bear upon their face sufficient evidence as to the manner in which they were formed, and many of the so called mossagates or mocha stones, are evidently merely accidentally rude resemblances to the plants whose name they bear. There are instances, however, where a considerable amount of evidence goes to show that the moss-like appearances in section, in such cases, have arisen most probably from a cause not greatly different from those appearances which are now to be seen on the landscape rocks. The variety of color might be formed in two ways, in the instance of moss agates. In the first place, if a diatomaceous growth occurred in a silicious substance, highly intermixed with peroxide of iron, or the decay of these organisms, the adjoining portion of such peroxide would become converted into a proto form, and thus become of more easy solution by carbonic acid, soluble silica or any free mineral acid; in consequence of which it would easily become washed out, on the conditions for the latter being present. On the event of such occurrences taking place, the coralline or moss-like form of the diatoms would present a lighter colored appearance than the surrounding parts of the stone.

In other cases the enclosing stone, where such organisms grew, might have originally been of a lightish color, and the whole of the carbon originally present may have been dissolved out from various causes which it would be easy but tedious to describe.

If, after this last named event has taken place, the stone should become saturated with an iron per salt, such would easily become decomposed if any alkali or alkaline earth was simultaneously present, as is almost invariably the case; the per or red oxide of iron would in such an event become precipitated, and fill up the prior existing diatomaceous forms, and so present a deep red color, on being cut into sections.

As if, however, to puzzle and put to fault, at least for some time to come, all fine drawn theories on the subject, such as I have perhaps rather spun out than made perfectly intelligible, Mr. J. S. Phillips has shown me a specimen which he brought from the Humboldt district, that is completely covered with what resembles small sprigs of moss sprinkled through the substance of the stone, which latter Mr. P. considers to be feldspathic. It certainly, to exterior appearance, resembles a compact feldspar or feldspathic lava, but the figures seen on its surface and interspersed through the mass negative such a conclusion, unless, indeed, both are formed by crystallization.

In slaty districts the moss-like forms so often alluded to, are frequently found delineated on each side of a slaty fissure, the sides of which, where such forms have become delineated, appear to be eroded. I had always, prior to seeing the landscape rocks, been in the habit of mentally ascribing the origin of such figures, to the effects caused by a lichen growth. I am now inclined to believe that diatoms have possibly some connection with these phenomena.

CERRO GORDO ITEMS.—Col. Stevens' furnace near Lone Pine is running at intervals. Difficulty is experienced in finding fire-proof material.

But little is done just now in Cerro Gordo on account of the season, the bridge over Owen's river having been washed away. Communication with Independence and Lone Pine is interrupted. The river is now crossed in a small boat, but the bridge will soon be replaced.

The San Ignaiw mine has been conditionally sold to San Franciscans. Twenty tons of first class ore will be taken out and shipped to San Francisco at once.

Mechanical.

EXPANSION OF STEAM.—GOVERNMENT EXPERIMENTS.—Just after the commencement of the late war, Mr. Isherwood was appointed Engineer in Chief of the Navy. Large quantities of steam machinery were at that time required for the service. Mr. I. having embraced the theory that the previous notions upon the subject of steam expansion were not based upon truth, planned this machinery in accordance with his own ideas. The result of the innovation was an extravagant expenditure of fuel and a low rate of speed. Complaints followed. Scientific engineers brought the matter to the notice of Congress; and in consequence, a Board was appointed some three years since, for the purpose of testing, by experiment, the soundness of Mr. Isherwood's views, and an appropriation placed at its disposal. The Board consists of three members of the National Academy of Science, three members of the Franklin Institute, Rear-Admiral Davis, Chief-Engineer Isherwood of the Navy, and Horatio Allen, President of the Novelty Iron Works. The experiments, says the *Artisan*, which have been conducted by this Board under the supervision of Mr. Allen, have been in progress for nearly three years, and the accurate and minute information which has been recorded will undoubtedly prove of the greatest value to practical engineers. The experiments thus far are decidedly in favor of the expansive use of steam. It is said by experts that the machinery of some of our largest naval vessels, built upon the plan of the Bureau of Steam Engineering, is so faulty as regards economy, that very important changes will have to be made in its construction.

WHAT IS STEEL?—The *Artisan* has an interesting article under the above head, a portion of which we condense: Steel was at one time defined to be "iron which will harden, temper and weld." Afterwards the name steel came to be understood to belong to iron combined with one per cent. of carbon. Later, new names had to be invented for the softer kinds of steel. The varieties became more numerous, and the boundary line more difficult to draw; and in fact it was found that the carbon could be so gradually decreased, as to form a continuous series between cast and wrought iron. "Cyano-gen" steel, "tungsten" steel, "chrome" steel, "titanium" steel, "silicium" steel followed. We propose that all the old styles of steel be called carbon steel, for the sake of distinction. In the widest sense which we now desire to give to the word steel, there would be such a thing as sulphur steel and phosphorus steel. Sulphur steel is the compound used in the Swedish gun factories for casting their heavy iron cannons. The great strength of these castings, and their extraordinary power of endurance, are ascribed to the sulphur. In fact, it is understood that sulphurous iron is purposely added to purer kinds of charcoal iron in order to produce this superior strength. Phosphorus steel is the material of the Berlin castings. An iron free from all other impurities, and containing a considerable percentage of phosphorus, is extremely liquid at a comparatively low heat; it fills the finest cavities of the molds, and can be cast into the most delicate forms. This material is brittle, and of small cohesive power when cold, and so it virtually has the very opposite properties to sulphur steel.

COMPRESSED AIR POWER DISTRIBUTED LIKE GAS.—Some French engineers have been making plans for the distributing of compressed air through a city by means of pipes, as gas and water are now distributed. The air may be compressed by steam power, or, if a river is at hand, more cheaply by water. With such an arrangement, all that would be necessary in any house for running a sewing machine, or turning lathe, or roasting spit, or anything else requiring power, would be to "turn on the air." The power would have to be paid for, of course, according to the exact amount used; whereas, if a small steam engine is employed, it must be kept running constantly to do work which is only required at intervals throughout the day. We have before alluded to the fact that such a plan had been proposed.

IMPROVEMENT IN IRON MANUFACTURE.—A Pennsylvanian by the name of Stewart, has patented a plan for purifying iron by pouring it in a shower direct from the blast furnace through a cylinder thirty feet in height, into which atmospheric air, or any other oxygen-bearing gas or vapor, is introduced. This is apparently not only an improvement upon the plan of forcing the air into the metal, which requires expensive apparatus, but it removes by combustion, not the carbon only, but also all other impurities, bringing, as it does, every particle of the metal into contact with the oxygen. The inventor claims to produce by this process, wrought iron ready for the rolling mills without machinery, and almost without time.

IMPROVED BLAST FURNACE.—A furnace invented by a chief engineer at Osnabruck, Germany, Mr. Lurmann, has now been in use for nearly twelve months. In this furnace, the hearth is closed all round, and there is neither tump, fore-hearth, nor dam stone. The slag stands constantly at the same level, and there is a cast iron slag hole, kept cool with water, about six or eight inches below the center of the tuyres. In the use of this furnace no stoppage is necessary for tapping and for cleaning the fore-hearth, and no cooling takes place. The orifice through which the iron is drawn off is opposite the slag hole, and of course at a lower level. The slag hole is not closed before tapping the iron, since the slag stops running of itself when the iron begins. The flow of slag may be regulated by means of the water, cooling the discharge piece; since by strongly cooling the latter, the slag is "frozen" in the passage, reducing the size of the discharge, and vice versa. During the entire process the blast is not interrupted, nor the pressure diminished. The size of the slag hole varies from one inch to two and a half inches. Furnaces of the ordinary construction can easily be altered to the new form.—*London Mining Journal*.

SINGLE AND COMPOUND ENGINES.—Compound engines, as compared with single engines, are necessarily much more complicated, and have more friction, and their cylinders present more external and internal cooling surface for the loss of heat by radiation. On the other hand, the total pressure upon the cranks is more nearly uniform throughout the stroke than in single engines, and there is not so great a range of temperature in either cylinder as there is in the cylinder of a single engine. The great uniformity of pressure upon the cranks of compound engines is of value in long stroke, slow-moving pumping engines, where a column of water has to be changed in direction at every stroke. But in quick-going engines, driving rotating machinery, single engines are found to have all the uniformity of motion requisite for fine cotton-spinning, even when the engine is expanding its steam ten-fold.—*Engineering*.

TESTS FOR STEEL.—Good cast steel will not bear a high heat without injury, and when raised to "white heat" will fall in pieces upon receiving the slightest blow; even at a bright red heat it will sometimes crumble under the hammer. When heated to a "cherry-red" it can be wrought with safety, and can be drawn to a very fine edge or point. Inferior steel will not so crumble, but in its action will approximate to good wrought iron. One of the tests to distinguish steel from iron is nitric acid, or aqua fortis; when the acid is applied to the clear metallic surface it will leave a black stain upon steel due to the carbon present, but will not so color iron.—*Artisan*.

TO COAT IRON WITH COPPER.—This may be done by plunging it into a boiling solution of a compound of copper with an organic acid (such as the double tartrate of copper and potash), with excess of alkali, and holding it with a brass wire during the immersion, which may be longer or shorter, according to the thickness of coating desired.

PERPETUAL SNOW.—Humboldt fixed the altitude of perpetual snow under the equator at 15,748 feet. On the northern side of the Himalaya Mountains it is about 17,802 feet; on the Alps and the Pyrenees it is about 8,850 feet; at the North Cape, in latitude 71 degrees, it is estimated at little more than 2,000 feet.

Scientific Miscellany.

MAGNETIC PHANTOMS.—The figures in which iron filings arrange themselves upon paper placed over a magnet have been called "phantoms." These are not mere objects of curiosity, but are useful for determining certain facts in regard to the poles of magnets. A method of fixing these figures for preservation has been to cover the paper with wax or stearine, and place near it something hot enough to keep this in a melted state. As soon as the figures are developed, the hot body is removed, and the wax cools, thereby fixing the figures. But a new and much better process has just been contrived by M. Meunier. The paper is impregnated with ferro-cyanide of potassium, and dried. Instead of iron filings, magnetic iron sand is used. When the phantoms are developed, chlorhydric gas is passed over them for a few seconds. This decomposes the ferro-cyanide, changing its yellow color to blue where the iron sand touches the paper. The sand is then thrown off, and the paper washed thoroughly in water. It is then dried, and can be preserved for an indefinite time. The sand is used instead of the iron filings, because it is not attacked by the gas; while metallic iron would give chloride of iron, which would soil the paper.

INDIUM.—This metal was discovered about five years since, in Freiberg, Saxony. Thallium having been found in some of the furnace products, the ore was examined to ascertain its source. After roasting, it was mixed with hydro-chloric acid, evaporated to dryness, and distilled. An impure chloride resulted, which was examined before the spectroscope for thallium; but instead of giving the line characteristic of that metal, a bright blue one appeared, which was entirely unlike that of any known substance, and after further experimentation, it was pronounced to indicate a new metal, which was named indium.

M. Richter exhibited at the late Paris Exposition, some ingots of indium which weighed about 1,500 grains, and were valued at nearly \$2.50 per grain. This gentleman has recently published his method of preparing the metal from zinc. The zinc is dissolved in sulphuric or hydro-chloric acid, and the residue, which is composed of zinc, indium, and other metals, is treated with nitric acid. The solution is evaporated with sulphuric acid, diluted, and a current of sulphureted hydrogen gas passed through. The indium is almost completely precipitated with the cadmium and copper. The precipitate is dissolved in hydro-chloric acid, and precipitated by ammonia. By repeating the process several times the whole of the zinc and cadmium is separated. Finally, the small quantity of iron still mixed with the indium is removed by a partial precipitation with ammonia and carbonate of soda. Indium is obtained by reducing the oxide; this may be effected by heating in a current of hydrogen gas, or by the power of a voltaic battery.

PRESERVATION OF STONE.—The *Chemical News* notices a new process for hardening stone by the application of a solution of oxalate of alumina to its surface with a brush. The stone must contain lime. Limestone, dolomite, or chalk, are suitable subjects for the process. The surface becomes changed by the application into oxalate of lime, which is very insoluble, while oxalate of alumina is easily soluble in water. Chalk so prepared becomes as hard as fluor spar. This promises to be a valuable invention for building purposes, and perhaps for the preparation of stone for the use of lithographers.

INTERESTING RELIC.—A papyrus which has been recently added to the British Museum, contains part of a treatise on geometry, with illustrative diagrams. Mons. Lenormant, a member of the French Academy, has been studying it with great attention. He has referred its date to a time contemporaneous with the reign of Solomon.

THE CHEMISTRY OF PAINTS.—Mulder rejects all oil paints for the protection of iron from rust, and concludes that coal tar makes the best coat for the purpose. He says that the essential constituent of linseed oil is "linolein," a compound of glycerine and linoleic acid. The formula for this acid is $\text{HO}, \text{C}^3\text{H}^4 \text{O}_3$. When exposed to air, it rapidly oxidizes; first to "linoleic acid," a sticky body resembling turpentine. On longer exposure, "linoleoxy" is produced. This is a tough, leathery substance, sharing many of the properties of caoutchouc. It is soluble in the same menstrua, and can be vulcanized like india rubber. It is manufactured in considerable quantities in this country, and is the binding material used to consolidate emery wheels. To prepare a good colorless drying oil, Mulder boils linseed oil for two hours with three per cent. of red lead, filters it, and then exposes it to sunlight in large shallow vessels, frequently removing the air above it. He denies the existence of aluminous and gummy matter in linseed oil, to which has been ascribed the slowness with which unboiled oils dry. Oxides and acetates of lead, he tells us, act as driers, not by precipitating aluminous matters, but by forming a little linoleate of lead, which rapidly oxidizes and communicates its activity to the oil.—*Mechanics' Magazine*.

We noticed not long since, the beautiful philosophical experiment which illustrates the effect of sonorous vibrations on the ordinary gas flame. Prof. Tyndall, of the Royal Institution, London, has repeated on a large scale, an experiment of Savart's, showing the influence of sonorous air waves on a jet of water. Water was discharged, obliquely, from an ordinary gas-burner. By the aid of an electric lamp, the shadow of the vein, as it broke into scattered drops, was thrown upon a large white screen. On sounding an organ pipe, or a steel tuning fork, of proper pitch, the drops would reunite in a continuous stream and form on the screen, a band, several feet in length. When the sound ceased, the vein again broke into drops. The minuteness of the force required to produce this effect, was shown, by placing a tuning fork just after its vibrations had ceased to be heard, against the support of the nipple from which the water issued, when the drops would instantly coalesce.

HEAT OF FUSION.—The melting point of metals and fusible silicates is lower than usually stated. Wedgwood's pyrometer and other similar measuring instruments have been found to be quite unreliable for high temperatures. Herr C. Sching has shown, by the application of the thermoelectric pyrometer, that the temperature of a glass furnace in operation is only from 1,100° to 1,250° Centigrade. Crystal glass becomes completely liquid at 929° C., and is worked at 833°. A Bohemian glass tube softens at 769° and becomes liquid at 1,052° C. Pure limestone loses its carbonic acid by heating for several hours at 617° to 675° C. The gas can be driven off more rapidly by increasing the temperature.

SORBONNE.—The new laboratory at the Sorbonne (Paris) will be one of the most perfect establishments of the kind. Rooms will be devoted to the pursuit of chemical researches, and to the study of optics, electricity, etc. In addition to the ordinary gas, the laboratory will be furnished with a similar supply of oxygen, which will be constantly manufactured so as to be always ready when required.

PRUSSIAN MECHANICS.—Several owners of Prussian machine shops and factories sent each a number of their employés to visit the Great Exhibition at Paris, at their own expense. Besides those who were thus enabled to go, a committee, which was organized for the purpose, sent over one hundred others, each of whom was required to furnish a report of his observations. Seventeen reports have already been sent in. These will be published for gratuitous distribution.

In a lecture given by him at the Royal Institution, London, Mr. Glaisher stated that the temperature of the air does not decrease uniformly with the height above the earth's surface, and consequently the theory of a decrease of one degree of temperature for an increase of elevation of 300 feet, must be abandoned. In fact, more than one degree declined in the first 100 feet, when the sky was clear, and not so much as one degree in 1,000 feet, at a height exceeding five miles.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

RECENT INVENTIONS.

A NEW BERRY BASKET.—Hitbert to most of our small fruit—cherries, currants and berries—have been received from the ranches in boxes or drawers holding from eight to twelve pounds each. These drawers fit into a larger box made in the shape of a small bureau. The plan is objectionable, as the berries are apt to be jammed by the weight of so many large tiers, and the juice spreading through the mass causes the whole to soon become moldy. Then, too, in retailing, the berries being delivered in paper bags, are subject to much squeezing and injury before reaching the table of the consumer. L. A. Gould, the fruit raiser of Santa Clara, has applied through this office for a patent on an invention calculated to do away with these drawbacks. By use of a peculiar machine he cuts any kind of moderately tough and pliable wood, as sycamore, cypress or laurel, in ribbons two and a half or three inches in width, and very little thicker than heavy wrapping paper. These ribbons are then cut into sections, say ten or twelve inches in length, and bent so as to form four sides of a square. Two of these are then placed together in the form of a flat-bottomed basket or open at the top, but double at the bottom, and the edges around the top bound by a narrow strip of tin run on with machinery, so as to hold the strips in their places and form a perfect basket. Each of these baskets holds a pound of fruit, and 126 will be packed in one box for shipment when filled. They cost less than two cents, perhaps not over one or one and a half cents each, and are intended to be delivered to the purchasers in the market to be retained. They will not add to the cost of a pound of fruit as delivered to the purchaser, being about as cheap as paper bags, and will be gathered in by old bottle and sack dealers to be resold at reduced rates to the marketmen. The invention will be found a very useful one.

NEW SEWING MACHINE.—It is stated that Mr. A. G. Waterhouse, of Sacramento, has invented a sewing machine—simple, cheap and plain, working like a pair of scissors.

KINMAN AHEAD AGAIN.—The Humboldt Times of Jan. 25th, says Mr. Seth Kinman has exhibited in that place during the week, the model of a potato digger of his invention, for which he has taken the necessary steps to secure a patent. Every one who has examined the machine expresses the conviction, that Mr. Kinman has at last produced what so many have in vain tried to accomplish, namely, a machine that will turn potatoes out of the ground. Aside from this opinion, Mr. Kinman asserts that it has been tested in the field, and that its success does not depend on future experiment.

PETROLEUM vs. GAS OR STEAM AS A MOTIVE POWER.—A new motive power has just been devised in Philadelphia, which, it is claimed, has great advantages over steam. In one end of the cylinder now in use is introduced a mixture of one-tenth vapor of petroleum and nine-tenths air. This combination is as combustible as gunpowder. When in operation a lighted paper is introduced, the gas takes fire, drives the piston head to the other end of the cylinder, and the residuum makes its escape through a chimney. The same operation is repeated at the other end, and thus the power is obtained. The taper glides back and forth like a weaver's shuttle, applying the torch at the right moment. No boilers, pumps, or condensers, are needed, and the whole can be packed in a very small space.

PATENTS RECENTLY ISSUED.

73,756.—PREPARATION OF DYE.—John Reynolds, San Francisco, Cal.:

I claim a new article of manufacture in a preparation for dyes of the materials specified, and substantially as described.

73,838.—METHOD AND MEANS FOR TREATING ORES OF GOLD AND SILVER.—Louis Edouard Rivot, Paris, France, assignor to Jacques Gaillardon, San Francisco, Cal.:

I claim 1. The roasting of silver and gold ore by superheated steam in the manner as herein described, that is, by separating

the ore from the flames by the interposition of cast iron plates, and by superheating the steam in the furnace itself, substantially as shown and described.

2. The reverberating furnace, substantially as herein described, when provided with steam pipes on or about the fire bridge for discharging steam upon the sole, whether such furnace be arranged for burning vegetable or mineral fuel, as set forth.

3. The arrangement, as herein shown and described, of a double furnace, or of a single furnace with two fire chambers, together with the use of cast iron plates at the level of the fire bridge, to separate the flames from the ore, substantially as set forth.

4. The arrangement of the furnace herein shown and described, in which superheated steam is made to impinge upon the ore, when separated from the flames of the fire chamber.

5. The method of amalgamating the roasted ore, without the adoption of any reagents, in apparatus of ordinary or suitable construction, substantially as herein shown and set forth.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

BROOKLYN PARK HOMESTEAD ASSOCIATION.—March 10th. Capital stock, \$150,000; 500 shares, \$300 each. Trustees: Edward Tompkins, Joseph DeForest, Henry O. Howard, Henry F. Williams, and Silas Selleck.

CITY GARDENS ASSOCIATION.—March 10th. Capital stock, \$600,000; 6,000 shares, \$100 each. Trustees: E. R. Carpentier, P. H. Canavan, G. H. Eggers, T. J. Poulterer, and O. Schoemann.

JUNCTION HOMESTEAD ASSOCIATION.—March 11th. Capital stock \$105,000; 300 shares, \$350 each. Trustees: S. B. Wattson, H. M. Rosekrans, Peter Johnson, and J. W. Hoffschneider.

BROOKLYN PARK ADDITION ASSOCIATION.—March 11th. Capital stock, \$27,000; 90 shares, \$300 each. Trustees: Samuel Gilmore, J. F. Harris, Charles M. Yates and G. W. Doolittle.

CITY VIEW HOMESTEAD ASSOCIATION.—March 12th. Capital stock, \$18,600; 62 shares, \$300 each. Trustees: Wm. Monahan, Simon Cohen, John G. Hayden, J. W. McKenzie, Jno. H. Morgan, M. Crowell, and H. V. Herbert.

OAKLAND VIEW HOMESTEAD ASSOCIATION.—March 12th. Capital stock, \$86,800; 248 shares, \$350 each. Trustees: O. B. Fogie, Silas Sellock, Louis Visana, Jno. G. Valentine and T. R. Reynolds.

VALLEJO WATER CO.—March 12th. Capital stock, \$90,000; 1,800 shares, \$50 each. Trustees: Edward Martin, Henry Connolly and Jno. Frisbie.

SISTERS OF MEROY.—March 12th. Trustees: Mary Gabriel Brown, Mary Baptist Russell, Mary Joseph O'Rourke, Mary Francis Benson and Mary Bernard O'Dwyer.

ELECTION OF OFFICERS.—SHIP CAULKERS' ASSOCIATION.—March 11th. President, Michael McNulty; Vice President, J. B. Robins; Secretary, Daniel Hanlon, Treasurer, John Dolan; Sergeant-at-Arms, James Lane.

BARRY & PATTEN have filed a trade-mark for a tonic cordial, called "The Excellent."

THE SIERRA COUNTY SNOW SLIDES.—The Downieville Messenger of March 6th, gives full particulars of the damage done by the avalanches at the Independence and Keystone mills on the 3d and 4th insts. All that remains of the Independence mill, the finest in the county, is the battery and one wheel,—the stamps and stems even being wrenched out and carried away. Mr. J. Woods, the Superintendent, was killed.

An Italian who owned some arastras below the mill, was carried away in his cabin, and was also killed. The Keystone mill was all destroyed except the battery and engine-house. The boarding-house was crushed, and five men killed therein. Some six or seven others were injured.

THE LAST SWEET THING IN EAR-RINGS.—Little globes of crystal, filled with water containing miniature fishes and mollusks, are, it is said, now worn in Paris as earrings.

PRESERVE YOUR SIGHT.—Adopt spectacles suited to your eyes. C. Muller, Optician, thoroughly understands his profession, 205 Montgomery street.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, March 14, 1888.

City Stocks.

Transactions continue light. California Steam Navigation stock sold at 75@74 per cent. The usual dividend of 1½ per cent. is payable on the 16th. San Francisco Gas at 70@73, and North Beach and Mission Railroad at \$60 per share. The usual dividend of the State Telegraph Company—\$1 per share, aggregating \$25,000—is payable on and after the 16th inst. The Bank of California disburses its usual dividend—1 per cent. per month—on the 16th inst. On the 10th inst., the Merchants' Mutual Marine Insurance Company disbursed a dividend of 1 per cent. on its capital stock. For full quotations, we refer our readers to the third page of this circular.

Mining Share Market.

During the past week the mining share market has maintained the activity heretofore noted, though the various descriptions of stock, with few exceptions, show a very material recession from former prices. Time sales are at present made with more freedom than for some time past, and the opinion seems to prevail that prices will fall to a still lower range before the regular spring renewal of activity and general advance.

HALE & NORCROSS—came into the market again on the 12th, immediately after the election, selling at \$2,900 seller 15.

At the annual meeting of this company, held on the 11th inst., all the stock—800 shares, or 400 feet—was represented. The following gentlemen were elected Trustees for the ensuing year: Jos. Barron, Thos. Bell, A. Hayward, Geo. S. Mann, M. Morgenstau, Thos. Sunderland and George Wallace. Subsequently the following officers were re-elected: Geo. S. Mann, President, and Joel F. Lightner, Secretary. From the President's succinct annual report we extract the following:

"During the first six months of the past fiscal year, the Trustees were enabled, from the profits of the mine, to pay the monthly dividend of \$125 per foot, amounting in the aggregate to \$900,000; when the fact became apparent, which had been feared for some time would prove to be the case, that the vein of ore, when opened on the 780-foot level, instead of maintaining the average width, as the 700-foot level above, narrowed to 5 and 4 feet, and in winzes sunk below the 780-foot level, to a width even less than the above. The reduced production of the mine, consequent upon the above cause, necessarily cut off all dividends, and compelled the levying of an assessment of \$150 per foot, to meet the expenses of the mine, and to pay for the labor and material employed in the construction of our new works. The Trustees then gave orders for the hastening of the sinking of the new shaft to the depth of 150 feet below the 780-foot level, at which point a drift was run that encountered a new body of ore, to the eastward of the quartz, containing the old vein above, and which promised, when first cut, to exceed in value anything that had ever before been found in the mine. This expectation, however, has not been altogether realized, for, in drifting north on the vein, bodies of porphyry and waste have been encountered, which at one time reduced the ore body to 2½ feet in width, but, at this present writing, has assumed a more promising appearance, and in drifting thereon, has again widened to 4 and 6 feet. In raising on the above body of ore, its fair quality is maintained, and its yield is estimated at from \$35 to \$40 per ton. The explorations thus far made are insufficient to enable any one to calculate, with any accuracy, the amount of ore standing in our present stopes, and its probable value. Our new works are now about completed, and, I believe, are in every way substantial, and ample for the purposes intended. Every preparation for the further sinking of the new shaft, for another level, is now made, and the work awaits only the orders of the Trustees to be again resumed."

Immediately after the election the Board ordered the sinking of the shaft to a further depth of about 137 feet. From the Superintendent's annual report we learn that on the first of March, 1887, the ore on hand amounted to 768 tons. The product of ore during the eleven months ending January 31, 1888, was 25,432½ tons, taken from the following points: 175 level, 254½; 300 level, 172; 700 level, 5,722½; 780 level, 16,215½; 830 level, 2,415½; and second station 930 level, 652½ tons. Of the quantity extracted, 213 tons of a low grade were sold, averaging \$4 35 per ton; 25,333 tons were reduced, showing a bullion product of \$864,938 45—an average of \$34 14 per ton, or 65½ per cent. of the company's assay value taken at the mine. The cost per ton of reducing the ore was \$14 23. From the Secretary's report we condense the annexed financial statement, embracing transactions from March 21st, 1887, to February 29th, 1888, both days inclusive:

RECEIPTS.	
Cash on hand, March 31, 1887.....	\$133,288 99
Assessment No. 30.....	60,000 00
Ore account—25,546 tons.....	\$63,925 45
Premium on bullion.....	6,326 46
Other receipts.....	82,453 71
	\$1,148,524 61
DISBURSEMENTS.	
Ore account—reduction.....	\$360,105 63
Dividend account.....	300,000 00
Fair shaft.....	212,634 85
Mine account.....	207,054 92
Sundry accounts.....	67,850 28
Cash on hand.....	183 93
	\$1,148,524 61
ASSETS.	
Cash on hand.....	\$183 93
652½ tons of ore, less reduction.....	12,989 70
C. G. Thomas, Superintendent.....	3,734 25
Property—debt.	
Real estate and hoisting works.....	121,489 36
Superintendent's residence.....	2,000 00
Personal property.....	48,014 80
Office furniture.....	954 00
	\$189,366 04
LIABILITIES.	
Quarterly tax on proceeds to Dec. 31st.....	\$471 28
Pioneer mill—reclamation.....	421 30
Due Bank of California.....	61,784 52
Bills payable.....	7,283 08
	\$69,960 38

Excess of assets over liabilities..... \$119,405 66
Crown Point—declined from \$1,895 to \$1,625, and closed at \$1,735. The drift from the 800 level continues

very wet and loose, and the ground is said to be a mixture of fine white quartz and porphyry. A winze ten feet in depth from the 700 level (twelve feet from the line) is said to be in good ore. The drift going south is seventy-seven feet from the line, and carries good ore in the face. Both east and west bodies, on 600 level, are reported to look well. Advice to the 10th, state that this drift on 800 level was improving, and the winze mentioned above was thirteen feet in depth and looking well.

OTHER—was in moderate request at \$197 50@170, closing at \$172 50. So soon as fair weather sets in the foundations at the new shaft for the erection of machinery will be completed. The recurrence of wet weather has so far frustrated their efforts.

COLLAR-POROSI—exhibited a little more activity, selling within a range of \$190@168, then at \$222 60, assessment of \$50 delinquent, and at the close realizing \$225. During the week ending March 6th, this mine yielded 170 tons of ore, while 232 tons were taken from the dump during the same time. The Blue Wing station produces about thirty-five tons of milling ore daily. The total bullion product in February amounted to \$30,526 93 against \$41,000 in January. The delinquent list will be advertised on the 17th inst.

SAVAGE—changed hands to a very large extent, under a material decline, falling from \$175 to \$149, rallying to \$159, and closing at \$157. During the week ending March 7th, 592 tons of ore were extracted, valued at \$18,408, or \$31 09 per ton, and of this amount the north mine, on the third station, yielded 398 tons. 680 tons were sent to mills, and at the above date 1,138 tons remained on hand at the mine. In the north drift, on the fifth station, a clay seam was found to cross the ore, and quits a stream of water issued from it; however, the ore inside the seam is said to be poor. In the south mine, on the same level, they penetrated the ledge, which is about five feet wide, but is reported not to look as well as on the fourth station; however, it is believed it will improve as they go south on it. The bullion product during the month of February amounted to \$181,658 96, leaving a surplus of about \$40,000 after paying the usual monthly dividend of \$5 to-day.

IMPERIAL—opened at \$260@272, declined to \$242 50, rallied to \$260, and closed at \$257 50. Work in the shaft and drift progresses slowly, owing to the presence of a large body of water. The ore in the west drift is growing poorer as they continue north on it, and the yield of the amount taken from this locality and recently reduced gives but \$15 62 to the ton. The usual quantity is extracted from the Alta and Holmes mines. The first clean-up from the Rock Point mill for the current month amounts to \$10,637.

OVERMAN—was less active, opening at \$179, dropping to \$144, advancing to \$185, and closing yesterday at \$180. The receipts of bullion aggregate about \$13,000, while about \$14,000 have accumulated at the office in Nevada, awaiting the receipt of Wells, Fargo & Co. to forward to this city. The ore is said to improve in raising on the 361 level, otherwise no change.

KENTUCK—has been well maintained, advancing from \$283 to \$295, falling to \$287 50, then selling at \$290, and closing at \$292 60. The receipts of bullion so far for February amount foot up \$38,043 14. A dividend of \$5 per share is payable to-day.

AMADOR—was in the market at \$300 seller 30. The mine continues to yield well. In February 2,106 tons of "rock" were reduced, showing a yield of \$22 72 to the ton.

GOULD & CURRY—sold at \$620@560, then at \$600 and closed at \$630. We learn that this company has about 4,000 tons of ore on their dump, and that the daily product of the old chambers is at present about forty tons.

YELLOW JACKET—declined from \$1,250 to \$1,130, rose to \$1,165, and closed at \$1,140. We learn of nothing important concerning this mine.

GOLD HILL QUARTZ—sold to a larger extent than for a long time past, improving from \$100 to \$125, falling to \$90, and at the close selling at \$95. We learn that the liabilities of this company, on the 29th ult., amounted to \$8,404 37, and as an offset to this they have merchandise chemicals, etc., valued at \$7,405 90, showing a deficit of \$938 47. An assessment of \$20 per share was levied on the 13th instant. As regards the mine the 450 level is said to show better rock in the face and in the "raise."

EMPIRE—was in the market at \$280. The bullion product in February amounted to \$16,601, against \$16,050 in the month of January.

ALPHEA—a few feet changed hands at \$1,350@1,320.... BELCHER receded from \$295 to \$255, then sold at \$272 50 and at the close \$275 is bid.... BULLION declined from \$60 to \$47 50, and closed at \$55. An assessment of \$10 was levied on the 6th instant.... DANEY improved from \$22 to \$37, and closed at \$35.... LADY BRYAN declined from \$29 to \$22 50, and at the close sold at \$23 50.... EXCHEQUER sold at \$47 50@36, then at \$43, and closed at \$42.... SIERRA NEVADA, at \$20@24, closing at \$22.... SEAGATED BELCHER opened at \$20, declined to \$15, and closed at \$18.

The sales in the Board during the past week have been as follows: Regular sessions, \$1,797,956; open sessions, \$451,416—total \$2,249,372.

CONTINENTAL Life Insurance Company
302 Montgomery street, corner of Pine.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville Miner, Feb. 29th: The contractors on the Imperial mine, have completed their first section of 25 feet.

The Superintendent of the Morning Star mine started a drift east from the 110-foot level of the shaft on Thursday. Prospects are favorable for soon tapping the lode and getting good ore.

Work has been commenced on the Isis lode.

Those sulphurets, noticed last week, taken from the Lateral tunnel of the Monitor C. M. Co., have been tested and found to contain silver. The decomposed substance in which they are found has been encountered for the last 26 feet or more. This tunnel is now in 73½ feet, and has cost so far about \$2.50 per foot. The rock is getting firmer now, however, and progress will be slower.

We noticed yesterday a commencement of work on the dam of the Mt. Bullion mill-site, just above the tunnel of the Imperial on Carson River. This Co. is running a tunnel for a series of claims near by.

Amador County.

Jackson Ledger, March 7th: Last Saturday, the semi-monthly clean up was made at the Oneida mine, and the yield was a little over \$13,000 extracted from about 1,000 tons of rock. The ore worked on this occasion, was taken indiscriminately from the mine, some of it considered of little value. The next run will be made from the ore taken from the 500-foot level, and will prove more valuable than any heretofore worked. The mill has been supplied with an additional boiler, and is now running sixty stamps.

The last month's run at the Coney & Bigelow mine, was a very encouraging one, when it is considered that the rock worked was of a miscellaneous character. From the plates and batteries \$6,300 was taken, and the value of the sulphurets saved is not less than \$1,000, and will probably run up to \$1,200. It is safe to say that the proceeds for the month, with 16 stamps, will amount to \$7,500. They are still sinking, and will continue to do so until their shaft is 50 feet deeper than at present. While the process of sinking is going on, the mill will be enlarged by an addition of ten more stamps—the material for which is on the spot, thus giving them a crushing force of 26 stamps.

During the month of February, not less than \$90,000 in gold was taken from four of our quartz mines—the Keystone, Eureka, Oneida, and Coney & Bigelow.

The owners of the Kennedy mine have made a contract with Messrs. Coney & Bigelow to crush 200 tons of rock for them. They will commence in a day or two, or as soon as the road from the mine to town will permit the hauling of rock.

The Hayward mine, known as the Amador Mining Co., located at Sutter Creek, in this county, has lately changed hands. Michael Reese, Lloyd Tevis, M. S. Latham, Mr. Gashweiller and John A. Faull, have purchased a large majority of the stock—paying therefor about \$1,000,000, and will in future have control of it. The ore exposed at present is estimated to be worth \$1,000,000.

Dispatch, March 7th: The owners of the Kennedy mine, contemplate building a mill at their mine, as soon as suitable lumber can be had and brought to the site.

The chlorination works of the Coney & Bigelow mine from a few days working, turned out \$3,500 in gold, which was assayed by P. Reichling, of this place, and found to be .996 fine.

Butte County.

Marysville Appeal, March 5th: Dr. O. P. Warren, of San Francisco, an old resident of this section of the country, whose appearance reminds us of "flush times in California," passed through our city yesterday, en route to his mining claim near Oroville, upon which there has recently been erected a quartz mill, for the purpose of extracting the "auriferous and argentiferous" metals. The Co. is now about making its first clean up, and hopes are entertained that the amalgamating pans may disclose a prolific yield for the first run, as the tests of the ore are very flattering.

Calaveras County.

Chronicle, March 7th: Intelligence from the Golden Gate claim is cheering. The last washing yielded the sum of 100 ounces, the result of the labors of six drifters for three weeks. As the gravel is exceedingly hard to wash, and has to be run through

the sluices without becoming perfectly dry to slack, it is safe to presume that not more than half of the gold was extracted. The tailings, however, are carefully preserved, so that no actual loss is sustained. During the coming spring it is the intention of the company to substitute more powerful machinery in the stead of that now in use, and erect a mill for the purpose of crushing the gravel as it is taken from the claim. We are also informed that the "incline" tunnel through which the mine is worked is to be enlarged to double its present size, so as to admit of the laying of two tracks.

The Co. owning the Mokelumne Hill and Campo Seco canal have again commenced sluicing the sediment out of their large reservoir. They intend to complete it so as to be enabled to keep up a supply of water, the year round, for the new mines at Cat Camp, where there are about 60 companies at work, taking out about \$18,000 per week.

A correspondent writing from Mokelumne Hill says: The Center House claim, between San Andreas and Stockton roads, was superficially prospected some years since, and has very recently fallen into the hands of the present company. I think this is a valuable mine, and without question a true lead. The present owners are erecting houses, whims, etc., with the view of thoroughly exploring the mine; and with the prospect already obtained, it will soon take its place in the front rank of Calaveras quartz mines. During the past summer there was five tons of rock from this mine, taken to Harris' mill, Sandy Gulch. It yielded at the rate of \$10 per ton. Later in the season there was a lot of 50 tons worked in the French Mill at Red Gulch; this lot paid \$7 per ton by simple battery amalgamation, and I am told that the screens used while crushing the last rock, were very coarse; this accounts in some degree for the great difference in the value of the ore crushed at Harris' and the Rich Gulch Mill. The next claim, that of D. C. Lamphear & Co's, known as the "Sport Hill Quartz Mine." There have been several hundred tons of rock from this mine worked in the different mills in this vicinity, with results varying from \$8 to \$14 per ton. The mine is in excellent condition at present, though not worked since the late heavy rains. Five tons of the rock as it came from the mine, were taken to Harris' Mill and worked; the result was \$11.50 per ton, and this result was obtained under circumstances that make it certain the rock was worth from \$1 to \$2 more per ton.

Another correspondent writes: Breckenridge Hill is turning out well, and it is reported that Mr. Grooms and company are doing very well. The winter has been so bad, in fact, that miners generally have done very little. The reports from the Sheep Ranch are favorable, but on account of the severity of the winter, very little prospecting has been done. McNair is putting up a double arastra, as fast as he can, and will, no doubt, be shelling out plenty of material for mint drops ere long. It is reported that Mr. Said has purchased the "Petticoat" claim, at Railroad Flat, for the sum of \$10,000.

Contra Costa County.

Gazette, March 5th: We have been shown a very handsome specimen of coal, taken out by Mr. John Taylor, eight feet below the outcrop, on a vein which has been distinctly traced for two miles in the vicinity where the Telegraph road crosses the San Pablo Creek. The vein, at the point from which the specimen was taken, is said to be four feet thick.

Lake County.

Grass Valley Union, March 4th: At the Wisconsin Hotel, in this place, we yesterday saw a specimen of cinnabar, which had just been received from Knoxville, in Lake County. This specimen shows richly in metal, and altogether is ahead of any we have yet seen from New Almaden. We understand that the mine from which the specimen we saw was taken, has been opened more than a year, and that a quantity of the ore is on the top of the ground.

Mariposa County.

Gazette, March 7th: Mr. Weher, proprietor of the Washington mine, near Hornitos, is now erecting a new 10-stamp mill. The chlorination process will be used to extract the gold from the sulphurets. This new process gives promise of obtaining good results from rock hitherto thought worthless. The Washington mine, has heretofore, under the management of Flint, Peabody & Co., paid well. The ore now being extracted is better than formerly—in addition to the old process the new one insures still larger profits.

Hite & Winants commenced work on Monday last on their ditch at Hite's Cove. This ditch is to convey water to their new mill, which they propose to erect when the weather opens sufficiently good to commence hauling,

Mail, March 7th: The Guadalupe quartz mill has been standing still for some two weeks past, partly on account of the fluming giving away, which has become rotten from old age, and partly on account of the bad condition of the weather, rendering it very disagreeable getting out and hauling rock. Mr. Hambleton, the proprietor, thinks he has struck the main lead in the mountain, which has been sought after for many years.

Nevada County.

Transcript, March 4th: Since last Saturday night it has rained almost incessantly, and yesterday at noon Deer Creek was almost as high as it has been during the season. It has continued warm during the storm, and the rain must have fallen a good part of the time almost to the summit. The present storm will benefit the miners if not followed by snow and cold weather.

Two companies are engaged in hydraulic mining at Gold Hill in this county, and they have a fine prospect. No work has been done in this vicinity since 1859, but Perry & Alban and Hazen & Co. have fitted up claims and commenced running a short time since. They now have abundance of water and a fine prospect to take out much gold.

March 5th: Dr. Farnham, who is opening the flat upon which Avery's old saw mill was located, has completed his tunnel and commenced washing the gravel. The claims are fitted up in first rate order, and the prospects are excellent.

The miners are doing first rate in the vicinity of Red Dog. Within the past ten days several new companies have started up, among them Duryea, at Buckeye Hill, and Hussey & King, at Red Dog. All these companies and others at work have a fair prospect for the season.

March 10th: The Italian Ledge, from which such splendid prospects were obtained so long as it was worked, has remained idle for a long time for want of funds. It is estimated that \$6,000 would be sufficient to open the ledge so as to obtain rock, and from the prospects obtained until the old company were compelled to stop work for want of machinery, there is every reason for believing that the mine would prove rich.

We understand that considerable damage was done to ditches by the late storm. A heavy snow slide occurred on the line of the Dutch Flat ditch last week, which broke and filled it up for some distance, cutting off the supply of water entirely. The ditch in the vicinity of the cascades on Deer Creek, was broken in several places, and it will require much expense and some little time to get it in order. We suppose that other ditches are much damaged above the snow line by slides.

Gazette, March 6th: The following companies started up their hydraulic claims at Scott's Flat on Tuesday last: The Beau Co., Creamer & Co., and the Hibbard Cut Co.; the latter being the property of the South Yuba Canal Co. These companies, as may be supposed, are having water in abundance, and such an amount of snow has fallen in the mountains that they are assured of a plentiful supply throughout the entire season. Mining prospects at Scott's Flat and vicinity were never better than at present.

March 9th: The complete hoisting machinery now on the Cunningham mine, consisting of engine, hoiler, pipes, tools, etc., is offered for sale.

Grass Valley National, March 7th: Some of our friends who have mining claims in the upper part of the county are making arrangements to proceed to their diggings forthwith. One thing they can be assured of, and that is a plentiful supply of water throughout the entire season.

March 9th: The Hope Gravel Co. are about commencing active operations. They have a cement mill already up, and new hoisting works; and in addition to the engine and the 8-inch pump already on the claims, they are adding an extra 12-inch engine and an additional 12-inch plunger pump.

Grass Valley Union, March 4th: While some of our citizens are looking after the wild cat land speculations, now so rife at the Bay, a capitalist from that excited quarter has quietly stepped into Grass Valley and bought up a large interest in the "Betsey" mine, and in the Orleans Mill property. Mr. Pearce, who is already an owner in the Empire, was the purchaser of the interests spoken of, and as a matter of course several thousand dollars changed hands in the transaction.

Placer County.

Dutch Flat Enquirer, March 7th: The miners at Gold Run are nearly all at work in their claims, having made satisfactory arrangements with the water companies in regard to the price of water.

Herald, March 7th: In the mine known as the Baker, or Harpending, the owners have struck as good pay as ever, on a level with the new mill, and are going to start the mill as soon as the weather will permit.

Sacramento County.

Folsom Telegraph, March 7th: For a number of months past, W. H. Knox and Charles Steele have been engaged in digging a ditch and building a flume, for the purpose of bringing water on several hills in the vicinity of the Western House, in this county. They have expended considerable capital and a large amount of labor, and now are taking out large quantities of gold. They have brought the water to higher elevations than ever before reached in that neighborhood, thus enabling them to open a new and extensive mining locality. They obtain their water from the main ditch of the South Fork Canal Co.

Shasta County.

Courier, Feb. 29th: McPherson & Co. will soon be ready to commence sluicing in their claim at Piety Hill. Their extensive flume is rapidly approaching completion.

Siskiyou County.

Yreka Union, Feb. 22d: A joint stock company has been formed by prominent citizens of Scott Valley, in the vicinity of Rough & Ready and Etna, for the purpose of mining the flat which lies along to the right of the road leading from Rough & Ready to Etna. This flat has been extensively prospected and is known to be rich. It is deep, however, to the bed rock, and the expense attending the opening of it so as to work it advantageously, will be considerable.

Tuolumne County.

Sonora Democrat, March 7th: Some two weeks ago, Mr. Thos. Mylar sent us a hottle of crystallized cinnabar from his mine near Horseshoe Bend. The mine is a valuable one, and has already yielded a large quantity of cinnabar, the greater part of which has been shipped to China, and the remainder sold in small quantities to the Celestials in neighboring towns.

We have seen some extraordinarily rich rock from the Arbona mine. Mr. Super-vielle has a candle-box full of it, and from its appearance one would have some difficulty in deciding whether to call it rock with a great deal of gold in, or gold with some rock in it.

P. B. Bacon has taken the old "Tennessee" quartz vein, above American Camp, and has crushed a small lot of rock which yielded 25 pounds of amalgam. Under the management of the former owners, rock from this vein didn't pay "salt." Bacon has quite a lot of rock out ready for crushing, and will continue getting out more till he has out enough to keep his 10-stamp mill running five or six weeks, when he anticipates a big "haul."

He is also owner of the famous Jones lead, near American Camp, and has a few hands at work getting out rock. One year ago Jones and his partner could have sold this vein for \$75,000 apiece. The two took out in a few months \$75,000.

From La Grange we have the following items: The claim of Mr. Thurstly, at the upper end of town, is paying well; after working through one channel in the flat, he came upon a high ledge, and on cutting through it struck another channel which promises to pay as well or better than the first. The claim of Richard Gannon & Co., on the same flat, is also paying large dividends.

There are several other claims in the immediate vicinity of the town which are also paying good wages.

On the north side of the river there are several companies at work whose claims have a good reputation.

All the work that is being done is with natural water; the dam of Reedy, Dye & Co. being washed out of the river last fall, leaves La Grangedry, except during a short period in the winter.

ARIZONA.

Miner, Feb. 15th: The news this week, from the mining districts adjacent to Prescott, is of the most encouraging character. In Big Bug district, the placer miners are making as high as \$10 per day to the hand. Work is being pushed forward on the Eugenie lode, with flattering prospects.

Two shafts on the Chase lode, in Haesayampa district, were several days ago down respectively 46 and 43 feet, and, at these depths, the lode was five ft. thick and the rock rich.

Joe Young called into our office yesterday and showed us the result of three tons of Chance ore, which he had worked in the Sterling mill, under very unfavorable circumstances. The three tons yielded 100 ozs. of nicely retorted gold and silver amalgam, worth, at least \$5 au oz. We are satisfied, from the color of the amalgam, which

is nearly yellow with gold, that it is worth several dollars more per ounce than the figure guessed by Mr. Young.

Yesterday, when Mr. Young left the Sterling mill, Mr. Reed was engaged in cleaning up, after having worked a quantity of Sterling rock. Reed was in fine spirits, and was satisfied that the rock would pay well.

County Treasurer Cory brings the following intelligence from Wickenburg. At Wickenburg everything looks prosperous and money was plenty. The Vulture Co's 10-stamp mill was running upon very rich rock. It was feared that in consequence of the muddy state of the road to the mine the teams would not be able to keep the mill supplied with quartz, and that in consequence, the mill would have to stop awhile.

Wickenburg's mill had started to work before Mr. Cory left. He adds his testimony that their rock is very rich. Fred. Henry, John Roundtree, and a German from Tucson, came up to Prescott with Mr. Cory. They found about 50 Mexicans placer mining at Weaver.

COLORADO.

Georgetown *Miner*, Feb. 20th: Mills & Bro. are working the Benton lode, on Brown Mountain. This lode was discovered about a year ago, and from what development it has received shows a vein second to none on that noted mountain.

We have seen some very fine galena and sulphuret ore from the Ethan Allen lode, situated on Douglas Mountain. This vein is now being actively worked, and shows at 15 ft. in depth, an ore vein two ft. in width.

Work has been resumed on the Henry Clay lode, on Saxon Mountain.

Work on the Munsell lode is progressing favorably, and the vein is increasing in width and richness.

We saw a silver brick at Clark & Co's bank day before yesterday which contained 349.50 ozs. It was the result of two tons of unselected ore from the Hise lode.

Central City *Register*, Feb. 20th: Errick Bottleson, of Ward, yesterday left us a sample of ore from the U. S. lode. The ore is mostly white, glassy-looking quartz, with decomposed zinc carrying a considerable amount of silver. He reports many lodes in that locality which are similar in character.

Denver *News*, Feb. 19th: We saw this morning, in Warren Hussey's bank, a splendid retort from the Briggs. It weighs 278 ozs., valued at \$6,300.

The largest bar of gold bullion ever made at the mint in this city, was run this morning. It weighs 270 ozs., and is worth \$6,400 in currency.

DACOTAH.

Virginia *Enterprise*, Feb. 29th: A letter from Cheyenne, received in this city yesterday, states that placer diggings, paying as high as an ounce per day, has been discovered west of the Sweetwater and about 35 miles from South Pass City. There is much excitement in Cheyenne about the new mines. There is sure to be a big rush of well armed and equipped miners to Sweetwater and vicinity this spring.

March 1st: Many persons in this city intend starting to the Sweetwater mines within the next six weeks or two months, and a party of eight men has been formed in Gold Hill to go to the same region as soon as the weather is considered to be sufficiently settled. We have the testimony of men who were in that region in 1852 that there are gravel banks on all the gulches that have the appearance of being rich in gold.

The Grass Valley *National* of March 6th, contains a letter written by E. T. Lake, from the Sweetwater mines, from which we extract the following: When we reached the mines there was no snow to be seen. There were about 150 men here at that time, about the 30th of September, but no houses, and every man with a fortune in prospective. The ledges are numerous and large and well defined—two in particular can be traced four miles. The gold is free, no sulphurets having as yet been found in the rock. For placer diggings there are five or six gulches found, and there is a ditch being brought into one of them $4\frac{1}{2}$ miles in length.

The Desert *News* says there are large numbers of men in Salt Lake City, en route on their way to the new mines, coming from the north and west, and thousands are expected in the spring and summer.

IDAHO.

The Rushville correspondent of the Lewiston *Journal* of Jan. 11th, says: Considerable work has been done on the ledges in this vicinity since my last. The Hic Jacet Co. have sunk their shaft upwards of 40 ft., and taken out several tons of ore. They will sink to the depth of 60 ft. and then drift each way from the shaft and stoop out the ore from above. The Sampson Co. have opened upon their lead and taken out sev-

eral tons of ore. The Spanish Co., upon the W. B. Knott lead have taken out about 25 tons of ore, one-third of which is very rich in gold. The vein at the point is fully 31 ft. wide. One claim west of this on the same lead, McDaniel & Co., have run an open cut and sheltered the same, and will sink upon the vein the coming week. Dan Dwight and Wm. Moore have run a tunnel and struck the Winfield Scott vein, and found the ore good. They will be able to take out about one ton of ore per day from the shaft they are to sink at the terminus of their tunnel.

Bacon & Tallis have opened at another point on the Scott, and will be able to extract a good quantity of rich ore.

Horton & Smith have opened No. 11 west on the Hic Jacet, and will be able to do good work in extracting ore.

Porter Bros. have also commenced operations on No. 4, east of the W. B. Knott. Another party is now negotiating for working upon No. 2, east of the Knott.

The Pioneer mill is running with good speed, notwithstanding the cold weather. It is crushing the Hic Jacet ore, and the prospect is fair for a yield per ton, equal to the Scott rock.

The Hic Jacet mill started their stamps last night, and with 40 lbs. of steam, gave 40 revolutions per minute, which gave to each stamp 80 drops per minute for the whole battery. They crushed 500 lbs. of Hic Jacet ore in 45 minutes. Everything moved to a charm. This was only done for a test. The mill will not be in readiness to crush regularly till about the 10th inst.

A new gold vein has been discovered about two miles south of Washington. It is called the Capital.

MONTANA.

Post, Feb. 22d: Bates & Trivits' 10-stamp mill, in Silver Star district, recently made their first clean up from 6½ days' run, and the retort amounted to \$7,500. The quartz yielded at the rate of \$140 to the ton.

Mr. Thomas panned out of 100 pounds of decomposed quartz, from the Granite Mountain lode, situated near the head of Tucker Gulch, \$27,000 in coarse gold. The quartz in this ledge is mixed with plumbago, and is said to be easy to be reduced and saved. At the depth of 70 feet, the lead shows a well-defined vein of ore three feet wide, nearly all of which is of uniform richness. Arrangements have been made for the erection of a substantial arrastra to commence operations in the spring.

Mr. Creigh deposited with Nowlan & Weary, on Monday, 56 ozs. of gold bullion, the product of the Union City mills, from Oro Cache rock. It is the result of what is equivalent to one day's run of the mill, from 20 tons of ore, and foots up \$1,260 in currency. The rock was taken from No. 2 north, at a depth of 160 feet, and averages \$50 per ton in coin.

The St. Louis & Montana Mining Co. at Philadelphia, are actively engaged in pushing forward work on their lead property, with indications that are in the highest degree flattering. Their mill has ere this started up again, and will be kept in permanent operation in the future, if no unfavorable accident should occur. The works of Messrs. Rumley & Co. are also in active operation, and a large return is confidently anticipated from their first clean up.

Cable City promises to equal if not exceed Phillipsburg, both in point of population and richness of the leads. Plaisted & Knowlan's mill is in successful operation, and running steadily on ore from the Atlantic Cable lode. It is the intention to clean up sometime during the week, when a large clunk of retort is counted upon.

Col. F. C. Deimling has let the contract for completing the tunnel to tap the John How lode, to Messrs. John Martin and John Carther. The tunnel is now in 253 feet, and it is estimated that in about 125 to 150 feet the lode will be reached. The work commences immediately.

From a private note received from a friend resident in Boulder Valley, we learn that the mines found here recently are fully as rich as represented.

The correspondent at Silver Bow writes as follows: At Butte City a large amount of work is being done on the ledges, in sinking and tunneling. The frame for the new mill is mostly completed, but the machinery is not expected to arrive before June next. We visited Yankee Doodle Gulch, a short time since, and were surprised to find so many persons wintering there. We had been led to suppose that gulch a balk, but with pleasure we learned that quite a number of claims had already paid over wages. We saw over \$20 washed out of the sluices for less than a day's work for two men. Messrs. Everest, Armstrong & Co. intend putting in a lengthy headrock flume in the spring. From Yankee Doodle we went to Black Tail Gulch; here all labor was sus-

pended. This little gulch will yield well the coming season. The water was conveyed into the gulch too late in the fall to accomplish much, yet some good pay was taken out. Next we visited Highland. Here we were most agreeably surprised. Where we expected to find little or no labor, on account of the depth of snow, we found all energy and enterprise. Seaves & Marshall were tunneling and getting out pay dirt; Overbay, Beck & Co. do as well as many others. In the way of quartz, wonders are being accomplished; Wilburn & Co. have nearly completed the tunnel to their ledge, just below town. This ledge is rich in copper for a depth of 60 ft., when the copper runs out and a fine quality of gold-bearing rock is found. On the Nevias Hill, all is life; a number of shafts are being sunk to a good depth, several already down 75 and 80 ft. The rock from the Noven, Only Chance and Gold Excel, will equal in richness any rock in the country. The Western Treasury, Burdon & Co's ledge, has a shaft 75 ft. deep, and is turning out good ore. Thompson, Johnson, & Myers, are running a tunnel to their silver ledge, to tap it 120 ft. deep. Flowers & Co. are putting a tunnel into the Only Chance. Berkrey is tunneling for the Nevias; McCord & Co. do. Florence & McCord have struck a ledge of very rich rock in their tunnels, about which there is a dispute. On the Ballarat Hill, quite as much life is manifest. The discoverers are running a tunnel to open their ledge about 200 feet deep; they are now in about 200 feet and expect to strike the ledge in April. Watson & Co. are in fine spirits. Todd & Co. are running a tunnel to open the Ballarat on the east line of No. 5, and the east line of the first extension. By these tunnels, the Tuleve, Ballarat, Bijou and Forest Queen, can all be worked. No less than nine tunnels are being run in this camp. En route for Silver Bow, I visited the Moose Creek silver lodes. Parties were at work on the Tiger lode, now presenting a crevice about seven feet wide, at a depth of about thirty feet. The ore looks of a fine quality. On the Parker lode they are down to a greater depth, with a splendid crevice and the finest walls ever seen. This ledge is rich in gold, as well as silver. By assay, it has been found to be well worth working for the gold alone, while it assays over \$900 per ton in silver. Dr. S. C. Day and Ben. Harvey have good ledges here.

NEVADA.

Esmeralda. Aurora *Union*, Feb. 29th: Toombs & Abrams at Pine Grove, are erecting another mill which will be running in a very short time. The Pioneer mill has just completed a run of near 600 tons from the Wheeler mine, which yielded over \$20,000, which the company intend to run into one brick, which will be the largest or most valuable one ever cast in Nevada.

Mr. Lytle, Supt. of the Oxford Beta Mining Co., several days since placed upon our table specimens of transparent mica or isinglass which he found in the seams of the bedrock while running a drift in the Oxford Beta claims. He says the seams are filled with mica and clay.

We are often at a loss what to say about our mines, not that we are ashamed of the products of them, but as soon as a mine is proved to be a paying one, it becomes a mystery, and the eager item hunter is told that from some misunderstanding in the company, fear of an interruption, and a thousand other trivial reasons they would rather have nothing said about their claim. During the past two years there have been many thousands of dollars worth of gold and silver extracted, which fact has been kept a profound secret.

Humboldt.

Unionville *Register*, Feb. 29th: Atchison made a short run at the Etma mill last week on ore from the Chloride ledge, with flattering results. When the Montezuma Works resume the operation of their smelting furnace, their mill will also be started for reducing the ore. The parties interested are satisfied they can select ore from this ledge to supply eight tons per day, which, in connection with the blast for the furnaces, will give full employment to the motive power of the works.

The refining works of the Montezuma, at Oreana, are turning out a little over \$4.00 per day in silver bullion, and everything is working finely, and the huge piles of crude bullion are rapidly disappearing.

Reese River.

We failed to receive any of our exchanges from Reese River during the past week, therefore our readers will have to wait until next week for news from that section.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Enterprise, March 4th: The Gould &

Curry Co. are now taking out an average of 30 tons of ore per day. Nothing is being done upon the main shaft, but work will be resumed as soon as wood can be procured from Washoe City, which will be within the next six weeks—perhaps sooner.

March 10th: The Crown Point works started up four or five days since and are again hoisting a large amount of paying ore daily. The company's main shaft is now about 800 ft. deep.

During the past week there was shipped from Wells, Fargo & Co's office in this city and Gold Hill, 3,549 ozs. of assayed bullion, valued at \$98,948.53.

Yesterday morning, quite an extensive cave occurred at the old Yellow Jacket shaft. By the caving a cavity was formed at the shaft 40 or 50 ft. in circumference and about the same in depth. The cave does not at all damage the works, as all the paying ore had been extracted at this point.

A body of rich ore was struck on the lower level of the Savage mine yesterday morning. The deposit was found near the old Potosi chimney. It is reported to be rich, but as yet its extent has not been ascertained.

Gold Hill *News*, March 6th: A couple of fine looking bars of bullion from the famous Lady Bryan mine, Flowery district, are on exhibition to-day at the California Bank, Virginia. The largest of these bars weighs 1,288.30 ozs and is worth \$1,105.06; silver, \$1,625.70; gold, \$429.26; gold, .018 fine; silver, .976 fine. The second bar weighs 1,249.30 ozs. and is worth \$2,082.43; silver, \$1,576.49; gold, \$451.94; gold, .017.5 fine; silver, .976 fine. Weight of both bars, 2,537.60 ozs.; total value, \$4,133.49. The bullion was melted and assayed by Bousfield & Co., successors to Theall & Co.

OREGON.

Dalles *Mountaineer*, Jan. 4th: Capt. Coffin who has just returned from the Ruckle mill and mine, brings flattering reports as to their success, as well as of the mines on Burnt river, which he says will be very extensive; and when the ditch, now working is completed, will open a larger scope of valuable mining ground than the Boise Basin is said to cover. There has also been lately discovered valuable placer and quartz mines in the Pochontas range of mountains.

Jan. 11th: Good reports continue to be received from Willow Creek; new discoveries being made every day.

At Cañon City times are dull; everything is froze up, and the snow is about four in. deep.

Feb. 15th: On the resumption of steam communication between this city and Portland, we anticipate a large rush of people to the newly discovered mines in the John Day, Willow Creek and Crooked River mining districts.

Jacksonville *Sentinel*, Feb. 22d: Last week a miner on Cayote Creek, between here and Canyonville, found a nugget of gold in his claim, weighing a little over 16 ozs., and worth \$273.50.

WASHINGTON.

Olympia *Transcript*, Feb. 1st: It has always been believed by those best acquainted with mineral regions, that the western portion of our county known as the Black Hills abounds in mineral wealth. The aspect of the country shows this, and what little prospecting has been done has proven that there is more or less of the precious metals in most of the streams and gulches. No large deposits have been found, nor do we look for any until a thorough exploration of that region. Different kinds of mineral bearing rock have been picked up at different times. Last summer, a gray mineral bearing rock was found in several places which is believed to contain copper. Specimens of nearly pure copper were found in the streams to the west, heading in the Olympic range and emptying into the Chehalis, a few years ago. These streams are undoubtedly rich in other metals.

WYOMING.

The Frontier *Index* states that incredible deposits of gold and silver have just been discovered within 15 miles of Souders, in Wyoming Territory. An exploring party has brought in several specimens of gold, silver and copper quartz, which were thoroughly tested, and proved to be as rich as any discoveries ever made, either in Montana or California.

DODGING A THUNDER-STORM.—In England there is a system of switches employed on telegraphic lines, by which one wire can be put in communication with any other, in stead of the direct one. In this manner a thunder-storm which interferes with its working may be escaped, and a circuitous route, free from the passing storm, secured. Fogs are dodged in the same way, a divergence in the route of a hundred miles or so causing no appreciable loss of time.—*Exchange*.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Mr. C. T. Hancey is our duly authorized agent for Sacramento County. Nov. 29, 1867.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

San Francisco:

Saturday Morning, March 14, 1868.

Notices to Correspondents.

SYLVANUS.—The character of the soil has much to do with the kind of vegetation most congenial thereto. There are remarkable differences to all kinds of vegetables, trees by no means forming any exception to the general rule. That so congenial to the growth of the oak, is the soil of Herefordshire, in England, where these trees are called "the weeds of Herefordshire." As a further example, we quote, for the benefit of our correspondent and other readers, the following from the works of the late Prof. F. W. Johnson: "New Brunswick presents examples of the most striking and immediate dependence of agricultural value, upon geological structure alone. On the outskirts of the coal-field, and rising up from beneath its edges, appear red sandstones, and red conglomerates, associated with limestone, red marl, and gypsum. These give rise to soils of a remarkable fertile character, in the midst, generally, of scenery of a most picturesque description. In such localities, rock and soil so closely accompany each other, that the most skeptical is compelled to admit that the changes in forest trees, in character of soil, and in nature of rock, are at once simultaneous, and determined by a common cause."

A GARDENER, San Mateo.—The tenacity of vegetable life is sometimes extraordinary, even amongst many of our ordinarily cultivated vegetables. The common horse-radish must form a very familiar example. A gentleman informs us, that he has often seen this plant growing between the paving stones in the newer squares and streets of the "West End" of London, where it does not become destroyed until the traffic is very large. Most of this part of London is, and continues to be built on what were formerly market gardens. To the above, a very singular instance may be mentioned. An apple tree was uprooted in England in a storm, which occurred in 1812, while loaded with fruit; eight years afterwards it was still alive; it had formed a root at a knee of the stem on which it rested. It bore at the time named, four bushels of fruit, and although a sickly and over-run with moss, was in a way to recover from the accident.

KALZEDA, Silver City, Nev.—Quartz crystals occasionally occur of enormous size. A group in the Museum of the University at Naples, weighs nearly half a ton. A crystal belonging to Sig. Raffelli, of Milan, measures three feet and a quarter in length, and five and a half in circumference, and its weight is estimated at 870 lbs. About a century ago, a drusy cavity was opened at Zinken, which afforded 1,000 cwt. of rock crystals, which at that early period, realized by their sale more than \$300,000. One crystal weighed 800 lbs. A group from New Hampshire, now in Dartmouth College, weighs 147½ lbs.

A READER, Sacramento.—The case of the floods, alluded to in our last number, had no reference to the floods occurring during the previous week or ten days; but the former one, when sand-bags had to be employed in order to preserve your city from being inundated.

J. B., Placerville.—We have no recollection of having referred, in the Press, to the matter of which you write. We certainly have no knowledge of any special locality where the mineral to which you refer can be found.

EMILE HENKE, Montana.—Your inquiries of the 15th ultimo have been received, and will be attended to next week.

"Life."

This little word contains in itself a problem, the solution of which has baffled the utmost efforts of scientists and philosophers. Diverse well-turned phrases are the sole result of all the cogitations and experiments of those who have attempted to define it. Anatomical and physiological explorations throw no light upon the subject. The minutest microscopic inspection of the cell,—the simplest form of organization,—does not help the matter. The splendid advances in science which have been made by the enunciation and demonstration of the doctrines, that matter and force are indestructible,—and that the various forms of force are mutually convertible,—afford no aid toward the determination of the question. Intimately connected though this question is, with those relating to matter and force and organization, it nevertheless contains an element, of which, as science, they take no cognizance.

An attempt has been made to define the term life, by saying that it is the *germinal capacity of an organism*; an inherent capability of reproducing itself,—that condition which causes an organism to be developed into a similar organism and no other,—so far as regards its typical form;—and which preserves itself intact for a certain period, or through certain stages, even though subjected to constant change by the operation of chemical and physical forces which are antagonistic to it, and which tend to destroy it by the disintegration of its component inorganic parts. All this is undoubtedly true; but we get no nearer to the answer of the question by it. This circumlocution does not explain to us what the essence of life is; it is simply a substitution of one word for another. The word *organism* is no more definable than the word *life*. Nor is it by any means satisfactory to say, that the different forms of life are analogous to the different forms in which inorganic matter appears; and that this "germinal capacity" aforesaid,—this power of repeating its own type only,—is the analogue, in the organic world, to that essential difference in inorganic bodies, which constitutes the difference between any two of those substances which we call elements. To a certain extent, this also is true; nevertheless, we feel instinctively that the analogy is by no means complete.

Life, whether of plants or of animals, is indeed dependent, for actual visible results, upon the same physical and chemical agencies,—all based upon the heat derived from the sun,—which, in the inorganic world, are effecting incessant construction and dissolution. Animal life depends, for the material which in it is the subject of these agencies, and which must be constantly renewed for its maintenance, upon plant life; and that, in its turn, depends for its material upon those substances which it elaborates, by the aid of the same agencies, from inorganic matter. The crystallization of inorganic elements into symmetrical forms, also depends upon the same agencies. Disintegration goes on alike in both worlds. The component parts of plants and animals are constantly returning to the soil whence they came, as those of crystals so return, when broken up by the action of natural forces. But the existence of the crystal, as such, ends there; its elements may thenceforth form part and parcel of a hundred different substances; its identity, so to speak, ceases with its disintegration; while that of the organism remains intact, in the cell or in the seed, as the germ of another organism which will be precisely like its predecessor, and which only requires favorable conditions, to repeat itself *ad infinitum*. The grains of wheat, which for three thousands years had lain quiescent in an Egyptian tomb, and which were to all appearance as lifeless as the stones which for so many centuries had imprisoned them, found, when planted in the genial soil of France, the conditions necessary for their

development; and are to this day reproducing, year after year, the identical life of bygone ages.

This life of the organism, or "vital force," or whatever else it may be termed, cannot then be classed with the extraneous, or physical, forces. That "correlation" which exists between motion and heat,—or between any other two forms or modes of force, does not exist between this force and those. It is not, with those, mutually convertible, the one into the other. Like those, indeed, it is instrumental in building up a form from inorganic materials. But unlike them, its work cannot be imitated in the laboratory. As their creations give back to the soil their constituent materials, so the organism—either by constant egestion during growth, by gradual decay after maturity, or by combustion,—gives back to the inorganic world, in exact measure, the whole of the materials which have been used in its construction. While again, these forces, their work being done, are, like these materials, again merged in the never varying sum-total,—the organism gives back the exact amount of physical force—derived originally from the sun—which was expended in building it up. But it is *only* the physical force which is restored,—and *not* the vital. The latter has in fact subsidized the former for its own purposes; and having done with it, has dismissed it.

This force is not derived from the outside world; and so far as it is connected with that world, it may more properly be called a "directive agency." It may therefore, although indispensable to the physical building up of the organism, remain in all its original integrity after the destruction of that organism, without conflicting with the truth, that all the matter and all the forces employed in each building up, being indestructible, are wholly resolved into their elements, and are ready to perform again the same part in the building up of other organisms. This "Vitality," or "Life," is the only element which has not been changed in the operation; which cannot be weighed or measured; which is intangible, undemonstrable, *infinite*.

It is useless for us to attempt to refer the phenomena attendant upon life to chemical, or electrical, or thermal action;—or, as has been done more vaguely, to "the operation of natural causes." We instinctively feel that life is something else than these. As we have said, it cannot be produced in the laboratory. So far as we know, it has no other source than other life, of the same kind, which has previously existed. In this one point, it is essentially unlike any thing which results from the meeting of material particles, under any conceivable natural conditions. Even the lowest forms of life contain this element,—this something which eludes our grasp. If we are utterly at fault in our attempts to comprehend the *lowest*, how much more hopelessly do we undertake to refer the *highest* forms to the "operation of natural causes!" As we ascend in the scale, we find the organisms increasing in complexity,—showing a greater and greater number of different organs,—until at last we reach the crowning creation—MAN. This one only, among all, is self-conscious; this only has the faculty of looking in upon himself; of reasoning and reflecting in regard to the nature of his own being. This is the highest of his powers. Even if we could conceive of all life below this,—including that of the more brutish races of men,—as attributable either to a casual bringing together of particles of matter, under favorable physical and chemical conditions;—or, even if, going still farther, we should refer it to a certain "principle" inherent in nature, which can propagate itself, and which is superior to the material forces which are constantly tending to destroy it;—this one faculty of self-study would distinguish man as an exceptional being, and would place him at an

immeasurable height above all other organisms.

But further:—As this faculty is strengthened and refined by exercise, the organism in like manner becomes more and more fully developed towards its own perfection; and this introverted faculty, keeping pace with that development, begins to have more and more frequent glimpses of its own real nature. Being infinite in essence, it at last recognizes its own infinity; perceives that it has existed from all eternity,—although now for the first time, as a distinct and separate individual; and that, while it is an emanation from a Supreme Personality, it was necessary, in order to become a personality of its own free-will, that it should pass through the gradually ascending steps of development, from the lowest to the highest. Here now the individual has attained his most exalted stand-point. It is through his own consciousness that he has gained it; and only in that consciousness does it exist. He cannot demonstrate his position to another intelligence. That, in the very nature of the case, is impossible; for, so far as regards his relations with other personalities, he is still trammelled by the same material surroundings that obstruct *their* perception. For himself, he well knows where he stands;—but he cannot define his position to the satisfaction of another. The two worlds, the finite and the infinite, are seen by him with equal distinctness; yet between them is a chasm which he cannot bridge. Across this chasm, he can *fly*,—so to speak,—but he cannot *walk*.

Of course the discussion of this subject is necessarily *speculation*. But we have said enough to warrant the conclusion, that there can never be such a thing as *Scientific Psychology*; for psychology has to do with the innermost man,—and Science is *demonstrable* truth. *Scientific Intellectual Philosophy*, however, there may be; and that must be based upon *physiology*,—the science which treats of the organism and its development; upon which development the intellect, or the power of mastering demonstrated truth, depends. With some minds, intellectual philosophy, so based, is the only available stepping-stone towards psychology; other minds are so constituted, that they generalize instinctively,—seeing intuitively the harmonious relations that exist between organic and psychical life. Undoubtedly the psychical conditions under which organic life is transmitted by parents to offspring, have much to do with determining the capacity of such offspring for psychical progress.

No man who has for a moment conceived the idea of his own eternal personality, with all the dignity attendant thereupon, can envy one who looks upon himself as merely a final result of organic life,—and therefore, necessarily, as subject to the destruction, and,—as an individual,—the *annihilation*, which sooner or later, all organisms, as such, are destined to undergo. That a man should be willing thus to degrade himself into a mere *arrangement of particles*, simply because he cannot demonstrate a point which, if true, must of course be undemonstrable, is scarcely conceivable.

If, then, life is something which, although intimately associated with the material universe, is nevertheless not subject to the laws which govern that universe,—what is it? We answer, that we can only conclude that it is a direct emanation from an Infinite source; that this source of life is perpetually in action; that the inorganic world is subordinate to it, and fructified by it; and that organization, in all its forms, is the result of such fructification.

NATIVE INGENUITY.—Certain native artists firmly fix pearls for drilling in the following manner: They fit them loosely in holes bored in a piece of wood, and then by wetting the wood cause the fibers to swell. The gem is thus grasped tightly without sustaining any injury.

Editorial Correspondence.

BOSTON ELASTIC FABRIC COMPANY.

This is one of the most "attractive" manufacturing establishments in the vicinity of Boston. It is located on the Boston side of Chelsea. The works were commenced some four years since, and are now turning out a large amount of suspenders, garter webs, braids, cords, and numerous other goods of a character not to be excelled in Europe or America.

The building is a substantial structure 50x250 feet, four stories in height. On the basement floor is situated the engine, which is of 200-horse power and one of the finest in the State. All the steam required for present use is supplied by three 5-foot boilers. The furnaces are fed with hard coal dust and screenings, costing \$3 per ton.

THE CRUDE RUBBER.

On this floor also is the heavy machinery required in the first preparation of the india rubber. The crude article used comes mostly from Brazil, in bag-like shape. We are told that the natives form a ball of clay or earthy matter on the end of a stick and dip it into the gum, the liquid adhering to it forming a perfect coating. The stick is finally withdrawn, the clay pulverized and extracted, leaving an empty sack. The gum is an inch or so thick, black on the surface, the balance looking like old cheese, and smelling twice as bad.

ITS PRIMARY MANUFACTURE.

This raw stuff is cut into fine strips by a circular knife, then ground to the consistency of mince meat, and cleansed thoroughly in a large vat. It is then "masticated" into regh sheets about the size of a common door mat. In this condition it is hung upon poles in the drying-room, five or six months. For the next process it is passed repeatedly between a set of 12 or 14-inch iron rollers, kneading or compounding it. Sulphur, plaster, and Paris white are among the articles introduced in compounding the material for various purposes. From these rollers it is taken, one-fourth of an inch or less in thickness, and put through calenders, which bring it out into belts of the requisite fineness for manufacturing purposes. These sheets are reeled off upon portable drums, placed in a steam-tight chest and vulcanized to the requisite degree.

Mr. David Hull, superintendent of the machinery department, has just set in operation a new calender of his own invention, which proves a decided improvement over all other machines, producing a superior sheet of rubber, and greatly economizing time and power.

CUTTING THE STRANDS.

Pieces of rubber, forty yards long, are wound with exactness upon drums of six feet diameter, where, by means of a rotary cutter, moving with rigid accuracy, the whole is cut into strands of full length—forty yards. This cutting apparatus far excels any before used,—saving considerable in material, furnishing more even strands and greatly facilitating the process. Its accuracy may be judged from the fact, that sixty strands per inch can be cut for use in the manufacture of fine braids and cords.

The looms and braiding machines are situated in the second, third and fourth stories. The former weave suspender and other wide webs, and the latter produce the braids and narrower fabrics.

AN ESSENTIAL IMPROVEMENT.

In suspenders, from sixteen to thirty-two rubber strands are woven with the linen or cotton warp. European and American manufacturers have heretofore been troubled to obtain a uniform tension on the different rubber strands, an irregular tension causing the fabric to "pucker," or draw up, in places. By a simple device this difficulty has finally been overcome. Three small grooved rollers are employed, the elastic strands making one twist around each. The first roller takes up the strands naturally,

without strain; the second and third each draw a little tighter, retaining the correct feed as taken up by the first, and thereby securing and holding a perfectly even tension. The cutting apparatus and tension movement mentioned, were invented by Mayor Hull, of Charlestown, a stockholder, who has been largely interested in establishing and managing the works.

LOOMS AND BRAIDING MACHINES.

There are fifty looms, each weaving from sixteen to twenty webs, ten or twelve yards in length, per day. The braiding machines are constructed with from six to seventy-five (often fifty-one) upright spools, or bobbins, carrying different colored strands,—briskly waltzing, bobbing and "chassezing" in various directions, like mad automatic figures. About 450 of these chattering, rollicking "emblems of industry" may be seen at full speed in a single glance. The operatives employed are principally females. The braids manufactured are mostly for ladies' wear, and are remarkable for even texture, elegant colors, patterns and figures.

To secure perfectly reliable colors, the company have recently established a dyeing establishment. They also have a paper-binding and box establishment, and a large room for trimming, finishing and packing. Producing superior fabrics, they wisely determine to place their goods in uniform and attractive condition in the market, under their own supervision.

A NEW ARTICLE

of manufacture, in this country, will soon be undertaken at these works—an elastic carpeting, for halls, churches, counting-rooms, etc. It is said to be very desirable, ornamental and economical, from the fact that when worn the material can be cheaply wrought over.

A MODEL ENGINE HOUSE,

is that of the Howard Engine Co., Charlestown, Mass. Along one side of the basement story is extended a trough with steam pipe for heating the water for washing the hose. At the end is the high tower, in which the base is elevated by pulleys for draining and drying, in perpendicular position. The apparatus for accomplishing this, and also running the hose upon the carriage, is very complete and "handy." The basement also contains a steam boiler, for heating the entire building, and a furnace for cooking coffee, etc., for refreshments for the company on their return from their labors. In the second and third stories, are five or six fine rooms. The engine (a steamer) is larger and more ornamental than any we have seen in San Francisco. Several returned Californians belong to the department.

A NEW BRONZE METAL MANUFACTURE.

The Tucker Manufacturing Company, of Boston, are now turning out a large variety of bronze iron work, consisting of gas-fittings, clock-cases, and other ornamental wares, many of which are of new, elegant and elaborate design. Their workshops are in the State's Prison, Charlestown, employing over one hundred prisoners. Fine iron castings are first produced; these are partially finished by grinding and polishing a portion of the surface, according to the design. Each piece of casting is brushed with, or immersed in linseed oil, and haked in an air-tight oven. This simple process is repeated three times, when the castings come out perfectly bronzed on all polished surfaces. This is accomplished entirely by the use of linseed oil and heat. Five or six ovens of about five feet by seven feet front, are now employed. The castings are piled loosely upon frames resting on iron platform cars, which roll upon a track in and out of the ovens. The first coating is haked about twenty minutes, and the last ten minutes. The bronze surface is very perfect and handsome, contrasting well with the unfinished portions of the iron. It is durable and invulnerable against oxidation. The wares of this company are rapidly com-

ing into demand. It seems to answer full well all the purposes of a large proportion of bronzed articles, which have heretofore been manufactured almost exclusively in European countries. The process is secured by letters patent.

A. T. D.

THE ST. JOHN DEL REY MINES.—The Morro Velbo mine, Brazil, belonging to the St. John del Rey company, a mine which has been worked many years, and has been deemed "the most valuable gold mine in the world," is, it is feared, so far as the present workings are concerned, ruined. At the last accounts, it had been on fire for days; but it was believed that it had nearly burned itself out, and would soon admit of an examination into the extent of the damage. The fire was without doubt the work of an incendiary; it commenced at two different parts of the mine. The superintendent is spoken of as a very unpopular man, he having meddled in the commercial and political affairs of many of the tradesmen in the neighboring town. The mine was considered by the Cornish miners employed therein, as unsafe; now that the timbers must have been destroyed, it is probably much more so than before. Eighteen lives were lost; only one of which was that of an Englishman—the remainder being negroes. These particulars were communicated to the *London Mining Journal*, by a gentleman who was at the mine at the time of the fire, and had just reached London on January 12th. The directors inform the stockholders, by a circular, that it will be imprudent to open the mine for some days; and that meanwhile it is impossible to form any opinion as to the extent of the damage done.

SAFETY STOVE FOR RAILCARS.—Since the Angola disaster, an arrangement has been invented, which promises to prevent in future the fire at least, which formed the worst feature of that terrible affair. The stove is placed directly over a reservoir of water, and is connected with it by several large pipes. If the car should strike an obstruction, run off the track, or even drag sufficiently to cause it to lurch to one side or the other, the stove is at once flooded, through the pipes; and if it should turn over, the water, (about four barrels,) is emptied from the reservoir and extinguishes any burning coals which may be scattered in the car.

[Extract from report of the Home Office, for Dec. 1867.]

"The Company's history for the past fifteen years shows favorably, and it stands out today ranks it among first class companies. It has carried out in good faith every contract made by it, never conceding a Southern claim during the war, while it is well known that many of our largest companies repudiated their Southern risks at the commencement of our National struggle, thereby increasing their assets. This honorable dealing of the Knickerbocker in the past, is a pledge of its future good faith."

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and descriptions of machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Roats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Co. Concentrators, Vacke's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Gams, Fans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russian Iron screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

6v15-4y

RUBY SILVER.—This ore,—says a writer on Mexican mines in the *American Journal of Mining*,—is always smelted, when in a sufficiently massive state to form lumps; when disseminated through the gangue it is treated by the Patio process, though not at all adapted for that system; but concentration is almost impossible, on account of the great brittleness of the mineral. In some districts this ore is the prevailing one; more especially in Sambrerete, about forty leagues northeast of Zacatecas, where the mines were excessively rich at the beginning of the century, but are now nearly abandoned. The mines of San Augustine is the only one in Catorce that produces this ore, and this has yielded great quantities of it. It is common also in Zacatecas and Guanaxuato, and the now abandoned mines were celebrated for their great production of ruby silver.

BENDING OF MARBLE SLABS.—A slab of marble was recently removed from a Philadelphia graveyard, which attracted some notice. It is 6½ ft. in length, 3 ft. wide, and 2 inches thick. It has rested upon posts, like a table top, since it was placed over the grave in 1817. A straight-edge, laid diagonally across it, shows that it has bent down in the middle an inch and a half. Other cases, similar to this, have been remarked; and an argument has been drawn from them in favor of the supposition that the curves and folds in rocky strata, due to lateral pressure, were not necessarily produced while the rock was soft, but might be the gradual result of long continued force applied since they became hard.

FRENCH STREET RAILWAYS.—A Paris correspondent writes that the street cars in that city run on flat rails, with wheels without flanges, the whole being kept in place by a fifth wheel but half an inch thick, running in a grooved central rail. This additional wheel can be raised by the driver at will, by means of a lever which is attached, and the cars run off the track. This is done to turn out for a car coming in an opposite direction, (which saves a double track on a road which is but little used,) or to run more conveniently on a down grade.

ELECTROTYPE CUTS, ENGRAVINGS

SPIEGELEISEN IN AMERICA.—The following is from a New York communication to the *American Journal of Mining*:

Spiegeleisen, or iron containing the proportion of manganese necessary in the process of making Bessemersteel, is now being imported from Germany, and is worth in this market \$53 gold per ton, the supply being limited. An article quite equal to that imported, is now being introduced in this market from Tennessee. The ore from which this metal is made is found in the Cumberland range, near Greenville, East Tennessee, not far from the Virginia and North Carolina line. The mountain that contains the ore is dome-shaped, and the ore is found at its very top in one vast deposit, requiring but little labor to extract it. Two men and a boy mine or quarry an average of twenty tons per day, besides doing the other work of the mine. The ore is a limonite or brown hematite, with a large admixture of manganese, and free from any contaminating impurities. Careful analyses have been made by Prof. Egleston and others, and it is found to be exceedingly pure, with a laminated or crystalline structure, presenting an appearance, in broken pig, like that of new silver. This appearance is caused by its mixture with manganese, of which it contains a large percentage.

PREPARED GLUE.—In order to have glue always ready for use, break up the glue and put it in a bottle; add to it common whisky; shake up; cork tight, and in three or four days it can be used. It requires no heating, will keep for almost any length of time, and is at all times ready to use, except in the coldest weather, when it will require warming. It must be kept tight, so that the whisky will not evaporate. The usual corks or stoppers should not be used; they will become clogged. A tinstopper, covering the bottle, but fitting as closely as possible, is better.

The Photographic Landscape Rock.

The Eighth Wonder of the World!—A Puzzle for Geologists!

On Exhibition at the
S. E. Corner Montgomery and California Sts.

THE EL DORADO PHOTOGRAPHIC LANDSCAPE CO. have on exhibition, at the southeast corner of Montgomery and California streets, a number of LARGE SLABS of the PHOTOGRAPHIC LANDSCAPE ROCK, from the famous quarry at Pleasant Valley, El Dorado County. Some of these slabs are five feet long and three feet wide, and they are PAINTED BY NATURE, IN COLORS, with Landscape Views, which run through the rock, being the same on both sides of the slab, no matter how thick or how thin. These Landscapes look as if they were photographs of the adjacent mountain scenery, representing Mountain Ranges, Hills, Forests, High Rocky Points, Lakes, Caves, Sea Beaches, and Plains. There are also pieces which look like the Grain of Wood. Geologists acknowledge that nothing has been found elsewhere of the same kind, and they are unable to explain its formation. ADMISSION, 25 CENTS. Open Day and Evening. 8x16-1m

THE GOLDEN ERA.

Founded in 1851, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a literary and family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

GRIDLEY'S PATENT WEATHER STRIP FOR DOORS.

This invention constitutes a most simple and inexpensive means for preventing the ingress of water beneath outside doors. It is effective and cheap, and can be readily

Adjusted to any Door in Use,
And presents neither hindrance to entrance nor unsightly incongruity to the neatest doorway.

COUNTRY RIGHTS FOR SALE.

FRANK ABELL,
3x16-3m 423 Montgomery street, San Francisco.

CARD.

THE UNOBSERVED, SINCE DISPOSING OF HIS Gallery on Montgomery street, has seldom been in the street without being asked where the best photographs were taken. Now, for the benefit of his friends and the public generally, he would recommend them to go to the COSMOPOLITAN ART AND PHOTOGRAPHIC GALLERY, No. 523 Kearny street, now owned and occupied by Messrs. HALSEY & SCRIPTURE. Both of these gentlemen are professional photographic artists—one of them having been in the business more than twenty years—and cannot be surpassed by any one in the State.
Persons wishing photographs taken will do well to give them a call. The above named gallery is one of the finest and most convenient in San Francisco. It being situated on the second floor, and its proprietors are the most accommodating and gentlemanly men in the business.
JAMES WISE, Portrait Painter.
N. B.—Prices as low as at any other Gallery in the city.

Solar Printing for the Trade.

Also Stereoscopic Views of California Scenery, at wholesale and retail, at the Cosmopolitan Art and Photographic Gallery, No. 523 Kearny street.

SAN FRANCISCO.

MOSHEIMER'S**NEW ROASTING FURNACE.**

Patent applied for.

This Furnace has proven the most successful of any ever
built on this Coast. A great number are in use now, and
many in course of construction. Their superiority over all
other furnaces, is as follows:

1.—The cost of building is only \$300 for a one ton Fur-
nace.

2.—They require less than half a cord of wood per ton
of ore.

3.—The ore is roasted to a spongy condition; while in a
common Reverberatory it cakes into globules.

4.—It is a saving of 50 per cent. of labor over any Fur-
nace in use.

A full size working Furnace can be seen at my Metallur-
gic Works in this city, by applying at my office.

JOS. MOSHEIMER,

328 Montgomery street, San Francisco.

A Sulphuret Mine Wanted.

**A SAFE,
CERTAIN,
AND
Speedy Cure
FOR
NEURALGIA,
AND ALL
NERVOUS
DISEASES.
Its Effects are
Magical.**

It is an UNFAILING REMEDY in all cases of Neuralgia
Facialis, often effecting a perfect cure in less than twenty-
four hours, from the use of no more than two or three
pills.

No other form of Neuralgia or Nervous Disease has failed
to yield to this

WONDERFUL REMEDIAL AGENT.

Even in the severest cases of Chronic Neuralgia and gen-
eral nervous derangements,—of many years standing,—
affecting the entire system, its use for a few days, or a few
weeks at the utmost, always affords the most astonishing re-
lief, and very rarely fails to produce a complete and per-
manent cure.

It contains no drugs or other materials in the slightest de-
gree injurious, even to the most delicate system, and can
always be used with

PERFECT SAFETY.

It has long been in constant use by many of our most
EMINENT PHYSICIANS,

who give it their unanimous and unqualified approval.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,
San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077
San Francisco.

DR. BEERS' PATENT
WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND PLACER MINERS, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address

DR. J. B. BEERS, San Francisco,
Per Wells, Fargo & Co's Express.

NOTICE TO MERCHANTS
AND
MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength; less danger in working; as goods require no slinging or lashing, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any fastening or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a Friction pawl, stop, to holding machines, and that they will prosecute any party making or using any machine infringing upon the same.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.

The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600

No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....850

No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought-iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, L, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mono county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866.

JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,

Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL. This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the Improved German Barrel, for a longer term than twelve months. All persons desirous of procuring, without having recourse to legal proceedings, for past infringements, or desirous of receiving Letters of License for the limited period named, are requested to address as below.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and efficient mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

JAMES BRODIE, Fulton Foundry,
CHARLES RADCLIFF,
Express Building, 402 Montgomery street,
San Francisco.

Belting and Lacing.

AN ENTIRELY NEW AND SUPERIOR ARTICLE OF

an exclusively mechanical preparation, made to order on short notice, and for sale by H. ROYER, at 435 Brannan street, between Third and Fourth. Refers to Eisen Bros., Pioneer Mills; Martin Stein, National Mills; Horace Davis, Selin Gate Mills; also, N. W. Spaulding, Saw Manufacturers.

PATTINSON'S
HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among millers as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit.

STEWART'S
CELEBRATED HINGED
Grinder and Amalgamator.

The Cheapest and Quickest Pan now used.

It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the muller to better advantage than any other Pan in use. While the steam, owing to the thinness of the cone, has a more direct effect of heating the pulp. E is the muller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle in the same bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation.

14v15-1am 1f

Generous Compliments.

The following is a sample of the generous acknowledgments which we frequently receive. We can only return thanks for such gentlemanly obligations, and assure our friends of our best endeavors to merit their respect and kindness.

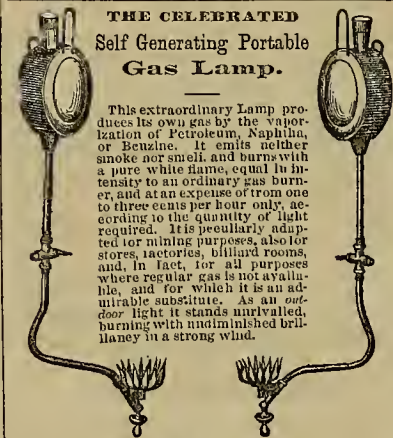

GEORGETOWN, January 22, '67.

MESSES. DEWEY & Co.—Sirs: I have the honor to acknowledge receipt of your letter of the 21st instant, transmitting to me "Letters Patent" on my application through you for an "Improved Machine for Grinding Ores."

It came to hand safely, and I am pleased to tender you my grateful acknowledgments for your success on my behalf.

Very truly yours,

M. A. WOODSIDE.

THE CELEBRATED
Self Generating Portable
Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivalled, burning with undiminished brilliancy in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor. Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State.

Boring Machines for Mining Purposes.

In a recent lecture at the English Royal School of Mines, Mr. Warrington Smyth mentioned two machines of the kind above named, which were already in use, and doing good service,—although some others had been failures, owing chiefly to their too complicated character. The first of these two machines was that of Mr. Döring, at Altenberg, near Aix-la-Chapelle; the second that of M. Bergström, a Swedish engineer at Persberg.

These machines were based principally upon the same idea. A small cylinder was placed in a convenient position opposite the spot to be bored, and then the horer, ending in the piston of a cylinder and brought to bear on the face of the rock, was made to strike with amazing rapidity, as many as 200 to 300 blows being given in one minute. As was the case with the ordinary boring tool, it was slightly turned before each blow was delivered. The power was acquired by compressed air, by which, at the same time, a jet of water was directed into the hole, and thus the sand and dust cut by the chisel were forced out. In this way, in moderately hard rock, 6 in. would be cut in six minutes—1 or 2 in. in the hardest granite. Mr. Döring had his machine at work last summer in London, and any one might have seen it at work on the surface of the dome. It was now working on hard dolomite. The kind of borer was that of the ordinary chisel, with the end formed like a reversed Z. One important point in respect to machines of this kind was, that although they might be everything that was required, so far as mere boring on the face of a working went, yet if they could not be easily moved, and still more, if they could not be used to bore holes, directed in any position, they would never be of any practical use in metallic mining. The apparatus of M. Döring, however, had this advantage, that it could be brought close to the spot required, and the cylinder could be moved up or down at pleasure. It stood on a solid platform, which, although required to be of a certain weight to keep it steady, moved upon wheels with readiness and ease in the levels and up to the work. A stout perpendicular column, so to speak, of iron stood in the middle of the platform; the cylinder with the cutting tool was attached by an arm to the column, and by a universal joint could be applied in any direction. The Persberg machine was similar, and it was now applied upon very hard granite rock. It was stated to have been at work two years, and to have driven several hundred feet in that time without any repairs of moment being required. It was remarkable, too, that the borers in these machines were not found to blunt anything like so soon as when the blows were given by the hammer, and thus they lasted five or six times as long. It would appear as though there was something in the rapidity with which the blow was given which preserved the edge of the tool. M. Bergström's machine was smaller than that of M. Döring, and only weighed about a hundred weight, which, of course, was an advantage in its practical application. It consisted of a cylinder of the same kind as that of M. Döring, attached to a long steel-pointed bar, which required to be fixed. That, however, was not a matter of moment, as the miners were so accustomed to fix struts and supports in their ordinary work that its fixing would take up but little more time than the removal of the other machines. The power in both cases was obtained from compressed air applied by means of flexible tubes.

The subject of boring machines is one of especial interest, and at this time is attracting unusual attention. We have conversed with an English gentleman at present in this city, who has a patent for a boring machine, which we hope soon to see introduced on this coast. Without doubt, the great labor-saving aid of such machinery, especially in sinking shafts, and in driving tunnels and drifts, will soon become general.

TERRIBLY HARD TIMES.—Over three millions of dollars was expended in New York city, during the past year, upon theatrical and other amusements. The Artisan gets these figures from the Internal Revenue office, and they must therefore be correct.

THE Union Coöperative Foundry, in Albany, N. Y., has declared a dividend of 80 per cent. among its members.

THE WAY IT IS DONE IN ENGLAND.—Under the head of "Projected New Companies," the London Mining Journal for January 18th, has the following:

Lincoln Gold Company, 160,000l., in 80,000 shares of 2l. each. The acquiring of the gold mines called the "Harpending and Quarry Gold Mines," situate in the township of Lincoln, Placer County, California, with the lands connected therewith; the acquiring of any adjoining concessions; the working and developing such mines; the preparation, manufacture, smelting, and sale of ore, metals, or minerals in any state, raised from such mines. The purchase of the business of, or the amalgamation with, any individual or individuals working mines or minerals in California, etc. The memorandum is signed by—Adolphus W. Young, 14 Pall Mall, gentleman, 1; Edwin W. Wingrove, South End House, Twickenham, gentleman, 1; William R. A. Boyle, 14 Old Square, Lincoln's Inn, barrister-at-law, 1; J. Walter Lukis, Woodlands, Isleworth, gentleman, 1; Alfred T. Thompson, 49, Gloucester-terrace, Hyde Park, London, 1; H. R. Treherne, 23 Clifton Villas, Maida-hill West, 1; The number of directors forming the board of management in England shall not at any time be less than five or more than nine. The subscribers to the memorandum of the association shall be the first directors. Qualification, 250 A shares in the capital of this company for his own sole use and benefit, upon which all calls shall then have been paid, and be resident in England. The residuats shall be entitled to receive amongst them out of the profits of the said company, and as part of the expenses of the management thereof, a sum equivalent to 100l. per annum for each director, and 200l. per annum for the Chairman; and, in case the dividends declared on the shares of the said company shall in any one year be not less than 30l. per cent. on the nominal amount of such shares, the directors shall be entitled to receive, as aforesaid, a sum equivalent to 150l. for each director, and a sum of 250l. for the Chairman for their services during such years; and in case the dividends in like manner declared shall in any year amount to, or exceed, 40l. per cent. on the nominal value of such shares, the directors shall be entitled to receive, as aforesaid, a sum equivalent to 200l. for each director, and a sum of 300l. for the Chairman, as a remuneration for their services during the last-mentioned years, and such sums so appropriated shall be divided amongst the directors and Chairman in such manner, and in such proportions, as the board shall from time to time determine.

[Since the above was in type, we have learned that this property was withdrawn, by telegram, before the date mentioned; the owners finding that the results of the working were not satisfactory.]—Eds. Press.

MORE RAILWAY CONVENIENCES.—Refreshment cars on the Chicago, Rock Island and Pacific road are to run in the middle of the train, with facility for free ingress or egress at either end; a dining counter extends along one side of the car, and passengers are served from a bill of fare, as they may order. In another portion of the apartment is the ladies' dining saloon, which is private and exclusive, while the car is so arranged that passengers passing in and out will not interfere with those dining.

Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done. M. PRAD, 8v13-1f Stove Store, No. 125 Clay street, below Davis.

ENLARGEMENT OF THE American Journal of Mining

Volume III, Commencing March 3.

In consequence of the remarkable success that has attended this Journal, the proprietors feel warranted in increasing its size to

Twenty Pages.

Thus making it the LARGEST and most COMPREHENSIVE Mining Journal on this continent, representing the Gold, Silver, Copper, Iron, Lead, Coal, Slate, Oil, and in fact all the Mineral interests of America, containing beautiful engravings, illustrating the latest improvements in mining, metallurgical and machinery.

The Journal has won the encomiums of the press of the entire country and Europe, and numbers among its contributors more eminent scientific men than any other weekly publication in America.

The reports of the markets in stocks, metals, minerals and ores, carefully corrected weekly, are an important feature of the Journal.

Subscriptions: \$4 per year; for six months, \$2.25—in advance; single copies, 10 cents. Specimen copies sent free. Address, WESTERN & COMPANY, Publishers, 37 Park Row, N. Y. 1v15-1amly

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. BLAKE & TYLER, Agents for the Pacific Coast. 14v11f

NEW YORK METAL MARKET.—We learn from Winterhoff's Circular of Feb. 6th, that the New York Metal Market is still inactive.

COPPER advanced from 1½ to 2c during the first ten days in January. Baltimore sold at 23c, and Detroit at 23½ c. On the 5th and 6th of February 800,000 lbs. were bought on speculation, at the figures named. The stock is chiefly held in strong hands on speculation or for investment, mostly bought last summer, at rates higher than the present ruling prices. Low as the price is, it is thought a still further diminution will be shown during the year. A number of Lake Superior companies have stopped work.

The English market showed an improved feeling toward the close of January. The large production in Chili seems to have depressed the price on the Continent, which depression is not felt in the English market by reason of the favorable action of the English tariff.

TIN.—In the first week of January, 2,000 slabs Straits changed hands in New York at 24c. gold, part to arrive, and shortly afterwards 800 slabs in Boston at the same price. Since then, to Feb. 6th, no wholesale transactions had taken place, and the quotation of 24c. is quite nominal. Five hundred slabs Banca sold at 25½ and 26c. English is quoted 23 to 23½c. The English market declined to 87s. for Straits, under the expectation of large shipments of Straits Tin from Japan, but it seems questionable whether more than a few isolated shipments will be made from there either to England or the United States.

LEAD is quoted at from 6½ to 6¾c. gold for ordinary foreign. The importations for January amount to 1,700 tons, which went mostly into consumers' hand. The stock is unchanged from that of Jan. 1st.

Subscribers who do not receive the *Mining and Scientific Press* in due time, are requested to inform the publishers.

Miners, Visitors to mining districts, R. R. EMPLOYEES, and TRAVELERS generally, should insure against all Accidents in the *Traveler's Life and Accident Insurance Company* of Hartford before leaving the city.

WM. McDONALD & CO., Gen'l Agents,
7v16-q3p 121 Montgomery St., opp. Occidental Hotel.

Accidents.

The Traveler's Insurance Company, of Hartford, Ct., insures against death or disabling injury by accidents; \$3 to \$50 per week paid the assured in case of injury preventing the prosecution of his business; \$500 to \$10,000 paid to his family, or legal representative, in case of his death by accident. No medical examination required. WM. McDONALD & CO., Gen'l Agents,
7v16-3m 121 Montgomery St., San Francisco,
Opposite Occidental Hotel.

ANOTHER CALIFORNIA ENTERPRISE.—A Factory has been started in this city for the manufacture of AUSTIN'S CELEBRATED BRILLIANT PASTE BLACKING. This preparation not only produces a most brilliant polish; but, unlike imported Blacking, it is pronounced the best LEATHER PRESERVATIVE ever introduced. Trades supplied twenty per cent. less than any imported article. Factory, No. 1 Montgomery Court, near the corner of Broadway. 26v15-3m

MEDICAL AUTHORITIES have announced that not less than one-fifth of the entire population of the United States are afflicted with Neuralgia in some form. Surely the man who can safely remove such a vast aggregate of pain is a great public benefactor. Such is Dr. Turner, of Boston, in Massachusetts. His "Universal Neuralgia Pill" is pronounced on all hands, to be an entirely harmless and perfectly certain remedy for this most torturing of all known diseases. See advertisement in another column.

DISEASES OF THE EYE.—During a late visit to San Francisco, we tell in with an old acquaintance from this country, Mr. G. W. Purdy, who formerly resided at Forrest City. About two years ago, while under treatment, we saw Mr. Purdy at the office of an oculist in that city, with eyes badly inflamed and the sight entirely lost. We saw him a few months later at another physician's, but his case was scarcely improved, and seemingly hopeless. His eyes have now entirely recovered, so that he goes about his ordinary business. From his own lips we learned that the restoration of his sight was entirely due to Dr. D. R. Morgan, whose office is at No. 627 Sacramento street, between Montgomery and Kearny, who cured him in the short space of eighteen weeks. Mr. Purdy mentioned several remarkable cures which occurred in the practice of Dr. Morgan during the time he was under treatment, among which was that of Mrs. Jane Albert, of Brownsville, Yuba County, and several others. Mrs. Albert had been afflicted with sore eyes from early childhood, and for eleven months previous to treatment she had not been able to discern light, nor had she seen the features of her youngest child, twelve months old. She had heard of the remarkable cures of Leonard P. Eder, of Marysville, and Joseph E. Haskell, of Sacramento, and determined to try Dr. Morgan. The result was that she was able, after ten days, to read ordinary newspaper print. Mr. Purdy was of course greatly rejoiced at the recovery of his sight, after so many trials and failures with different physicians.

This above is clipped from the *Mountain Messenger*, of February, 1883. 10v16-3m

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

- ANSTED'S Gold Seekers Manual. 1 vol. 12mo. cloth. \$ 3.00
- ANTISELL.—The Manufacture of Photogenic or Hydro-Carbon Oils, from Coal and other Bituminous Substances, capable of supplying Burning Fluids. By Thomas Antisell, M. D. 1 vol. 8vo. 3.00
- BARSTOW.—Sulphurets; What they are, How Concentrated, How Assayed, and How Worked; With a Chapter on the Blow-pipe Assay of Minerals. 1 vol. 12mo. cloth. 1.00
- BLAKE, W. P.—Geological Reconnaissance in California in 1863-4. 4to., with plates, maps, sections, etc. 10.00
- BLAKE, W. P.—Silver Ores and Silver Mines, etc. 8vo. 2.00
- BLAKE, W. P.—Mining Magazine and Journal of Geology, etc. 8vo. 5.00
- BLAKE, W. P.—Annotated Catalogue of California Minerals. 8vo. 50
- BUCKLAND (Rev. Wm.)—Geology and Mineralogy. 2 vols. 8vo. cloth. 10.00
- BOURNE (John)—Handbook of the Steam Engine, illustrated. 2 vol. 12mo. cloth. 3.00
- CONGDON.—Mining Laws and Forms of California and Nevada, and the Mining Ordinances of Mexico. 184 pp. flexible cloth; 1864. The only complete and up-to-date. 2.50
- DUFRENOY.—Mineralogie. 5 volumes, 8vo. 20.00
- DANA'S Manual of Mineralogy. Revised edition. 200 illustrations. 12mo. cloth. New Haven, 1868. School Edition. 2.25
- DANA'S Manual of Geology. Numerous Illustrations. 8vo. half morocco. Philadelphia, 1883. 6.75
- DANA'S Text-Book of Geology. Illustrated. 12mo. cloth. Philadelphia, 1864. 2.25
- ELDERHORST'S Blowpipe.—Analysis and Determinative Mineralogy. Third edition, revised. 8vo. cloth. Philadelphia, 1866. 1.50
- FAIRBAIN.—Iron: its History, properties, and Processes of Manufacture. By Wm. Fairbairn, C. E. L.L.D. 1 vol. 8vo. New Edition. 5.00
- FEUTCHWANGER.—A Popular Treatise on Gems, with map, plain and colored illus. 606 pp. 12mo., cloth: N. Y., 1867. 2.50
- GOODYEAR'S Translation.—A Treatise on the Assaying of Copper, Silver, Lead, Gold and Mercury, from the German of Th. Bodeman and Bruno Kerl. 1 vol. 12mo. cloth. 2.50
- HUMBLE.—Dictionary of Geology and Mineralogy. Third Edition, Revised. 1 vol. 8vo. cloth. 9.00
- HOSKOLD'S Practical Treatise on Mining Land and Railway Surveying, Engineering, Etc. 1 vol. 8vo. cloth. 16.00
- KUSTEL.—Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada; also, a description of the General Metallurgy of Silver Ores. By Guido Rust, Mining Engineer, illustrated by accurate engraving. 1 vol. 8vo. cloth. 5.00
- KUSTEL.—A Treatise on Concentration of all kinds of Ores: Including the Chlorination Process for Gold-Bearing Sulphurets, Arenites, and Gold and silver Ores. By Guido Rust, Mining Engineer and Metallurgist. Illustrated with 120 diagrams on 7 plates. 1 vol. 8vo. cloth. 7.50
- LAMBORN.—Rudimentary Treatise on the Metallurgy of Copper. 1 vol. 12mo. limp cloth. Illustrated. 1.00
- LAMBORN.—Rudimentary Treatise on the Metallurgy of Silver and Lead. 1 vol. 12mo. limp cloth. Illustrated. 1.00
- MITCHELL'S Manual of Practical Assaying. 1 vol. 8vo. cloth. 10.00
- MAKINS.—A Manual of Metallurgy, more particularly of the Precious Metals, including the Methods of Assaying them. By G. H. Makins. 1 vol. 12mo. cloth. Illustrated by upwards of 60 engravings. 3.50
- OVERMAN (Fred).—A Treatise on Metallurgy; comprising Mining, and General and Particular Metallurgical Operations. 1 vol. 8vo. cloth. 7.50
- PIGGOT.—The Chemistry and Metallurgy of Copper. By A. Snowden Piggot, M. D. 1 vol. 12mo. cloth. 2.00
- PHILLIPS AND DARLINGTON.—Records of Mining and Metallurgy; or, Facts and Memoranda for the Use of Mine Agents and Smelters. By J. A. Phillips and John Darlington. 1 vol. 12mo. cloth. 4.00
- PERCY (John).—Metallurgy; the Art of Extracting Metals from their Ores, and adapting them to various Purposes of Manufacture. Iron and Steel. 1 vol. 8vo. cloth. 15.00
- PLATTNER AND MUSPRATT on the Use of the Blowpipe. 47 Diagrams. Third edition, revised. 8vo. cloth. London, 1864. 6.00
- Practical Use of the Blowpipe; being a Graduated Course of Analysis. 12mo. cloth. New York, 1858. 2.00
- SCOFFER'S Useful Metals and their Alloys. 1 vol. cloth. 5.00
- SMITH'S Blowpipe.—Vade-Mecum. The Blowpipe. Characters of Minerals Alphabetically Arranged. 8vo. cloth. London, 1862. 1.75
- URE'S Dictionary of Arts, Manufactures, and Mines. 2,300 Engravings. From last London edition. 3 vols. 8vo. cloth. New York. By J. D. Whitney. Per. vol. quarto. 6.00
- WHEELER & RANDALL'S Quartz Operator's Handbook. Flexible cloth, 12mo. San Francisco 1863. Per. vol. quarto. 1.00

Any of the above Books will be furnished by return mail or express, on receipt of the price with postage added. Any other books desired will also be furnished at the lowest San Francisco retail prices. Address,

BELDUKE & CO.,

OF CONCORD, N. H.

Long employed at the celebrated firm of Downing & Son have opened a manufactory of

Concord Wagons,

Of all descriptions, at No. 820 and 822 Folsom street, between Fourth and Fifth streets, San Francisco. Orders received for Buggies, Expresses, and Light and Heavy Thorough-brace. Carriage Springs made to order, 18v15-lam-6m

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION.

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, PROF. LAYRES (a meritorious Teacher at good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Seelt.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. C. Pelton.*

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. H. Hill.*

I regard it as one of the best treatises upon these important branches, perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—*F. W. Hatch.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas in sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Denman.*

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—*Caroline L. Atwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, A. M.*

I believe the work will be a valuable and much needed addition to our school text-books.—*Herman Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*H. Brayton.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—*John Curry.*

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. Exactly calculated to interest. It will soon become a necessity in every lawyer's library.—*Charles A. Tuttle.*

Its clearness and comprehensiveness make it easy.—*G. W. Bourie.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of being fully and thoroughly acquainted with each in its entirety, and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—*S. F. Examiner.*

This is an ease in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stockton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Maryville Appeal.*

Not only one of the best of its kind, but, what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Travelling Agents.

Address DEWEY & Co., Mining and Scientific Press, San Francisco.

W. T. GARRATT, City BRASS AND BELL FOUNDER.

Cor. Mission and Fremont sts., SAN FRANCISCO. Manufacturer of Brass, Zinc, and Anti-Friction or Babbet Metal Castings; CHURCH AND STEAMBOAT BELLS,

TAVERN AND HAND BELLS AND GONGS, FIRE ENGINES, FORCE AND LIFT PUMPS, Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other joints, Spelter, Rolder, and Copper Rivets, &c. Orange Cocks, Cylinder Cocks, Oil Cocks, Steam Whistles, HYDRAULIC PIPES AND NOZZLES.

For Mining purposes, Iron Steam Pipe furnished with Flanges, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal." Highest Market price paid for OLD BELLS, COPPER AND BRASS.—*6t*

ESTABLISHED.....MAY, 1860

Mining and Scientific Press PATENT AGENCY.

DEWEY & CO.,
SOLICITORS OF American and Foreign patents,
505 Clay Street, corner Sansome, SAN FRANCISCO.

Patent Cases of every kind conducted. Attention given to Re-issues, Extensions, Interferences, Rejections, Appeals, etc., etc.

ASSIGNMENTS, POWERS OF ATTORNEY, AND LETTERS OF ADVICE CAREFULLY PREPARED.

ENGRAVINGS FINELY EXECUTED.

COPIES OF PATENT PAPERS, Issued by the United States or Foreign Countries, procured in the shortest time possible.

A. T. DEWEY. O. W. M. SMITH. W. B. KWER.
THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,
Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises SIXTEEN PAGES (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS,
All progressive information, in fact, transpiring with THE TIMES—which cannot be obtained from books.

The MINING AND SCIENTIFIC PRESS is now in its FIFTEENTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1880: RESOLVED, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

As an ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the PRESS is unsurpassed. Rates moderate.

SPECIMEN NUMBERS of the PRESS and Patent Circulars, sent free.
DEWEY & CO.,
San Francisco
Jan. 1st, 1888.

Mining AND SCIENTIFIC PRESS.

Single Copies, Fifteen Cents.

Terms: One Year, \$5; Six Months, \$3.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

DEWEY & CO., PUBLISHERS,
And Patent Solicitors.

SAN FRANCISCO, SATURDAY, MARCH 21, 1868.

VOLUME XVI.
Number 12.

TABLE OF CONTENTS.

Payne & Stephens' Concentrator.
Turning a Movable Wheel Around a Fixed Wheel.
A Great Work Projected.
Hardened Plaster of Paris.
Editorial Correspondence.
Reduction of Antimonial, Argentiferous and Auriferous Ores.
What a Mechanic Should Strive for.
California Academy of Sciences.
Lined Ship at Naples.
U. S. National Banking System.
The Freiberg Barrel Process.
The Molasses Tellurides.
Legislative Announcer.
Carbonic Acid and Cresote.
A Decapitated Chicken.
Hitting of Iron.
Sawing Machines Sixty Years Ago.
Pump-act.
Difference in Water for Manufacturing—An Important Matter.
Waste of Mining Products.
Consumption of Smoke.
Paper Boat.
Hitching Petroleum.
Means of Ascending and Descending Shafts.
Grenat Railways.
Behind the Age—A New Mexican Cart.
South American Exploring Expedition.
San Francisco Market Rates.

MECHANICAL MISCELLANY.—
Condensation in Steam Engines.
Cylinders; Hardening and Tempering Steel; Rectifying Piles with Acids; Steam Packing; Improvement in Steam Generators; Hand-turning Tools for raising Piles; Finishing; Crank-pin Joints; Making Chains without Welding; Steel Humps; Locomotive Boiler-tubes.
SCIENTIFIC MISCELLANY.—
Conclusion of Ga. by Metals; Stereoscopic Novelty; New Method of Refining Alloyed Gold; Precipitation of Copper and Nickel by Alkaline Carbonates; Prevention of Danger from Lead Pipe; Bronze-Iodized Rubber; Adulteration of Dyes.
MINING SUMMARY.—
Comprising Intelligence from the various counties and districts in California, Arizona, Colorado, Idaho, Nevada, New Mexico, Oregon and Wyoming.
San Francisco Mining Shareholders' Directory.
Notices to Correspondents.
New Incorporations—List of Offices.
New Patents and Inventions.
San Francisco Weekly Stock Circular.
Stock Prices—Bid and Asked.
San Francisco Metal Market.

Payne & Stephens' Concentrator.

We give herewith an illustration of the new machine recently patented through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, for concentrating gold or silver sulphurets. This machine, as will readily be perceived, is quite dissimilar in appearance and mode of operation from anything ever heretofore introduced on this coast. The principle employed is that of the bundle, which is extensively used in Europe. This principle was for many years operated altogether by hand; but machine bundles have now been long employed, and their mode of operation is explained and illustrated in Ure's Dictionary. The European machine, however, is quite imperfect and unsatisfactory when compared with the in-

thus spread out evenly over the floor, another set of arms D, D, are made to revolve, dragging after them small strips of cloth as shown, which produce just enough disturbance on the surface of the accumulating sands to prevent the formation of ridges in the descending water and sand, keeping the entire surface even, so that the lighter portions may be readily carried down by the water, while the heavier portions—sulphurets or any metallic particles—will, by their greater specific gravity, remain at or near the circumference. The pipe, I, is used to convey any additional water to the central reservoir that may be needed.

The chief improvement in this machine consists in elevating, by automatic action, a circular wall or ring around the central outlet, with more or less rapidity, according

constant operation at the Eureka (Watt's) mine in Grass Valley, where, we are assured, it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill near Virginia City.

TURNING A MOVABLE WHEEL AROUND A FIXED WHEEL.—This discussion still exercises the readers of the *Scientific American*. That journal, in its issue of Feb. 29th, fills more than a page with letters on the subject, of which it says it has received about half a bushel. Several of them show that their writers totally misconceive the question. Our readers will remember the remarks which we made upon the subject in our last. They will also remember the questions which our correspondent, "Jeigh Arrh" quietly and pertinently propounded for the consideration of the *Scientific American* and its friends, viz:—"Does the moon revolve on its own axis? If it does,—how often?" We observe that the writer of one of the letters above mentioned makes the same point. He says:—"The problem referred to,—'How many revolutions, on its own axis, will a wheel make in rolling once around a fixed wheel of the same size?'—is merely another form of the old question,—'Does the moon turn on its own axis in revolving around the earth?' If the moon turn on its own axis, then the wheel makes two revolutions."

Now savans agree, that as the moon always presents the same side to the earth, it must turn on its axis in the same time in which it revolves around the earth. If, then, the wheel revolves once on its axis, when passed around the fixed wheel with a given point on its periphery constantly in contact with it, it must revolve twice when it is rolled around, and consequently presents all points. Nothing can be more evident.

We suspect that the *Scientific American* sees that it has made a mistake,—and yet puts far off the evil day of confession, by publishing these letters. Perhaps we shall be treated to the whole half-bushel,—before the "two-revolution philosophers" are admitted to be in the right.

THE STATE UNIVERSITY.—The Bill creating a State University and locating the same at Oakland, passed the House on Monday, and will undoubtedly receive like favorable action in the Senate, and receive the sanction of the Governor. The unanimity of feeling among the members of the Legislature, in reference to this matter, is most gratifying to the friends of education on the Pacific coast.

SPONGE MATTRESSES.—The material called "elastic sponge," is to be introduced in this city, for the filling of mattresses, cushions, etc. It is the least valuable of the sponges, and is found in abundance at the Bahamas. It is said to answer the purpose perfectly, and to be considerably cheaper than hair. An agency for the sale of it is to be established in this city.

PAYNE & STEPHENS' CONCENTRATOR.

vention of Messrs. Payne & Stephens, as herewith illustrated. But as the difference in their construction is of but little importance, we will proceed directly to the description of the one now in hand.

In looking at the illustration, the outer circle marked A, should be considered as constituting a part of the floor of the room where the machine is operated. The pulp is fed into the inner circle or depression below the floor, through a screen which is fed with the necessary quantity of water by the pipe F. E is an endless belt to which are attached brushes, which revolve within the screen for the purpose of breaking up lumps of sand which may have formed; the sand thence passes through the screen into the trough below, and is conducted to a central reservoir from which radiate hollow revolving arms, C, C, by which the pulp is delivered to the circumference of the central depression in the machine. The floor of this depression is inclined on all sides towards the center, at which is seen the opening for the discharge of waste. The pulp being

to the mass of sand which is put through the machine, or to the greater or less extent to which it is charged with sulphurets. In all machines heretofore used, this has been done, and of course very imperfectly and at great inconvenience, by hand. This automatic action is effected by a tangent-screw at N, working into a gear connected by a rod with the circular wall below. This motion is made more or less rapid by means of the conical pulleys, J.

The machine is exceedingly simple, is constructed of wood, with the exception of a few feet of gas pipe and seven or eight hundred pounds of castings. It can be built by any carpenter. One machine, costing about \$1,400, is sufficient to concentrate the sand from 25 to 30 stamps. But very little power is required, which is applied to the pulley shown at the upper left hand corner of the engraving. The machine can be readily operated by the power exerted by a single hand applied to a crank in place of the pulley.

One of these machines may be seen in

"DRY AS A DICTIONARY."—That phrase must pass away. Look into the elegant quarto edition of Webster's Unabridged; see the three thousand illustrations, handsomely engraved, interesting and instructive pictures. They are interspersed through the work in just the order in which you can most readily find them, with definition and description. Then, again, they are classified, convenient for comparison. The more important drawings are marked with letters or numbers of reference, by which you may learn the proper source of each portion. Take, for instance, the ship, the engine, the human skeleton,—and we find each piece and each part so plainly noted that a child may understand it, and name its proper term. But this is only one of a hundred or more improvements made in the recent edition, worth mentioning to our readers. No studious reader can afford to be without it, or will hesitate to buy it upon examination. Ignorance of its great merits and improvement over former editions, is the only reason that it is not already in the hands of thousands who, sooner or later, are bound to secure it.

STATE GEOLOGICAL SURVEY.—A last night's special dispatch to the *Bulletin*, announces that the Appropriation Bill was passed without striking out the provision for the Geological Survey. No sum, however, was specified for the carrying out of the work. Several motions to insert in the bill different amounts, were voted down.

CALIFORNIA MACHINERY FOR AUSTRALIA. The Union Foundry of this city has just shipped one of Hendy's concentrators to James Henty & Co., of Melbourne, Australia. Two of the same machines have also been shipped to the Washington Mills, Hornitos, Mariposa county.

CHANGE OF MINING OFFICE.—By reference to his card in another column, it will be seen that Mr. J. M. Buffington, mining Secretary, has changed his office from its long-time locality, in the Government Building, to Room 37, on the third floor of the New Merchants' Exchange.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

(Written for the Mining and Scientific Press.)

The Freiberg Barrel Process.

EDITORS PRESS:—I have a few remarks to make touching Professor Rowlandson's article on the above subject, which I read with the more interest from the fact that some years ago I had imbibed the usual Californian prejudice against barrels and in favor of pans—a predilection which subsequent experience with both has, in a very great measure, reversed.

It is to be regretted that the language of these articles is, in some parts, a little obscure, as their utility is thereby somewhat impaired; but as it is not my desire, any more than my business, to play the part of critic, I will simply call attention to a few points of practical interest, and, before closing, will give my reasons for the preference I have expressed.

I do not think it is fair to draw a comparison between the "Washoe Pan Process," as applied to crude ores, and the barrel or any other process applied to roasted ores. By roasting the Comstock ore, at least eighty per cent. of the contained silver can, I believe, be extracted with pans, and it is a question if more could be done with barrels; but it has been found, as regards the poorer class of ores, that the raw treatment leaves a larger margin of profit. I am informed that the rich ore is not, at present, worked without roasting.

"A less costly mode of procedure to attain the same object" (chlorination) is a desideratum which I concur with the Professor in deeming attainable, as well as improvements in the lining of barrels; for which latter purpose I suggest Raneom's artificial stone, or the recent patent process for hardening and preserving wood.

As to the duration of barrels, I think the term of twelve to sixteen months must refer to Brodie's patent, as I have known the common kind to be worn out in three months, and have not known them to last longer than nine months.

It is a question whether "the fact of gold existing in combination with Washoe silver ores" would not be an obstacle to the use of barrels, in connection with roasting, without subsequent grinding, either wet or dry, which would considerably enhance the cost.

It appears to me that Leca's "*beneficio de hierro*" could not be successful, because the metallic iron must prevent the effect of the magistral, by precipitating the copper from solution; and it is in this, the simplest way, that I account for the "non-success of Leca in introducing iron into the torta," while "the success of Gellert in introducing the same agent into the Freiberg barrel" is quite as easily understood, as in this case the chloride of silver was already formed; and the reduction of the salts of copper, not always or necessarily present, would be simply an inconvenience, which moreover could be avoided in barrels, though not in pans;—of which more anon. In the same way, in preference to the Professor's more complex view, I explain the non-effectiveness of chloride of copper when used in iron pans, the simple fact being that that salt cannot exist in an iron pan long enough to do its work on the ore.

What reason can the Professor give why this explanation is not sufficient without going further? His idea of the necessity of a preponderance of the chloride of copper will not stand the test of experiment, for however little there may be, it will act, on suitable ore, to some extent, more or less; and in the case which I have in my mind, would, if not decomposed by the iron, have been constantly reproduced. Neither will it do to say that the chloride of copper is

not decomposed by the iron, in consequence of the "peroxidation of the salts" of the latter, because the facts will not sustain that theory, as I have often observed in the working of pans. To this matter of peroxidation in a pan I shall allude again.

The fact is, there is no necessary connection between the barrel process and those of Leca and Barba; as in the former the interposition of roasting with salt effects a complete change in the conditions of the problem of amalgamation.

As to the action of chloride of copper on sulphide of silver, I am not sure that it is quite well understood. I have met with men, both theoretically and practically informed, who maintained that the generally accepted view of the reactions in the Patio process was not correct; and I have somewhere read of a certain Mr. Brown, in Brazil, I think, who looked upon an oxychloride of copper, formed by atmospheric action on the magistral, as the immediate means of decomposing the sulphide of silver. In Lower California, no magistral is used in the Patio; however, none but surface ore is thus treated there.

I have my own suspicions on this subject; but can only state as a fact that a solution of chloride of copper, hot or cold, has no action whatever on the crystallized sulphide of silver of the Silver Sprout mine in the Kearsarge district (which, however, may have contained a trace of lead); while on the dark pulverulent ore, containing carbonate of silver and sulphur, arsenic, lead, etc., it acts instantly, forming chloride of silver and oxide of copper, with copious evolution of carbonic acid; yet, however long it is left, or however the copper salt may predominate, there remain particles of sulphide of silver untouched. Whether sulphide of copper is formed or not, I have not ascertained.

This action of chloride of copper is the secret of the very successful working of the Kearsarge ore by J. B. Low last fall. The pulverized ore, mixed with chloride of copper (sulphate of copper and salt), was eteamed in wooden vats before being treated in pans. It gave nearly double the result attainable by treating the same ore directly in pans, with or without chloride of copper. Does not this prove my position with regard to chloride of copper in pans?

Similar means were used by me in treating the ton of silver Sprout ore, alluded to in a recent letter to the Press; but, as I used a barrel, the conversion and amalgamation were carried on simultaneously, with the further advantage of obtaining fine bullion. This brings me to the consideration of the matter already touched on, of preventing the copper in roasted ores from entering the amalgam, which, I have asserted, can be done in barrels, but not in pans.

Setting aside the use of copper in place of iron in barrels, as a means to this end, it can be effected in presence of iron by means of lime, ashes, etc., provided the amalgamation is not continued too long; for if it be, the copper finally passes into the amalgam, in consequence of a reaction between the chloride of iron produced by decomposition of chloride of silver and the precipitated oxide of copper, as pointed out by me in an article on the subject, published in the Press some time in March, 1865, and in the caption of which the printer, by omitting a note of interrogation after the words "a new reaction," exposed me to the charge of hastily assuming the credit of a discovery, when I only meant to ask a question.

At the time of writing that article, having had no experience with barrels, I had only pans in view; and the difference between them and barrels in this matter might be adduced in support of the Professor's opinion as to the peroxidation of the salts of iron in pans, as, although the protosalts of iron (and of zinc) will act on the oxides of copper, it is probable that the persalts act more rapidly. But I cannot think that the formation of persalts of iron can take place to any great extent in presence of so much metallic iron, not only in the bottom and sides of the pan, but also pervading the pulp in fine particles resulting from abrasion of the shoes and dies.

For this reason, as well as from observation, I doubt the formation of calomel in iron pans from the causes assigned by the Professor. I have known it to be produced on several occasions, both in pans and bar-

rels; but never in the former when a proper length of time was allowed to elapse before putting in the mercury, unless, in consequence of the subsequent addition of "chemicals," such as muriatic acid, or nitric acid and salt. Even in Knox's slow pans I have never known this phenomenon to occur spontaneously from the oxidizing effects of air; much less would it be likely in those of rapid motion.

I will not dispute the Professor's views as to the formation of double or compound chlorides of mercury and other metals, though I am inclined to think the presence of lead or copper in the mercury has a protective effect on the latter; but I have observed in cases of loss from the formation of calomel, that a large portion of that loss was due to that "extreme divisibility" of which the Professor's friend complained, and which is caused by the adherence to the surface of the particles of a film, or a coat of the calomel, or perhaps the multiple chloride above alluded to, which makes their agglomeration extremely difficult. The fine white powder obtained on "panning out" tailings containing such mercury, will, on rubbing, yield innumerable minute globules, which, by patient manipulation, may be induced to unite.

As to "preventives," they are simple and well known as regards pans and barrels. As a "cure," I have found exposure of the mass to the action of light, most efficacious; but that was before the introduction of eodiam-amalgam, which would probably be better.

The idea that barrels can only be used to advantage with roasted ores, is a mistake. On the contrary, I suspect that all ores which can be treated in the raw state at all, in pans, can also be so treated in barrels, and in many cases with much better results if finely pulverized previously.

My reasons for preferring barrels to pans, as a general rule, may in some measure be deduced from the preceding. They may be summed up thus: Barrels being charged but once, or at most twice in twenty-four hours, do not necessitate the constant presence of skilled operatives. After they are properly charged, it is sufficient to see that they are kept in motion till the time for preparing to discharge arrives. I have found that the changing of the motion from fast to slow may be dispensed with. With barrels, fewer temptations to or opportunities of peculation are offered to attendants. The chief operator is less dependent upon subordinates for the proper treatment of the ore, and he is enabled to conduct operations on a larger scale with more precision—this is a very great advantage in countries where skilled help is uncertain. By suitable management, fine amalgam can be obtained in barrels when it would be impossible in pans. I have known the difference to equal .940—450 in the fineness. Barrels, in working roasted ore, require no heating. (They may easily be arranged for heating when required.) Lastly, as to working ores without roasting, barrels admit of the application of chemical treatment which is inadmissible in (iron) pans.

As to the relative amount of power required, I have heard various opinions; my own, without being able to speak positively, is that the difference is not in favor of pans, especially those of rapid motion.

One great bugbear of the barrel process, is the grinding of the ore after roasting. On this point, I can say that my experiments, made unceasingly, during a period of three months, (a very short time, I admit), with pans alone, and other comparative experiments with pans and barrels on roasted ore of very refractory description, showed no advantage to be derived from fine grinding, provided only the larger and harder lumps formed in the furnace, were removed by sifting.

It is my opinion, that with roasted ores previously crushed through a sieve of forty holes to the linear inch, and sifted, after roasting, through one of eight or ten holes to the linear inch, no material advantage is gained by trituration greater than can be attained in barrels. When gold is present, however, it may be different; and in treating ore raw, it cannot be too fine.

Another prevalent error is, that dry crushing is necessarily very slow, and that it requires a special kind of mortar. Doubtless it can be done faster by a mortar discharging on two or four sides, than on one only; but that is also true of wet crushing, and a common wet crushing battery, discharging only in front, can, if of solid construction, be made to crush dry more than one ton per stamp in twenty-four hours through a screen of forty holes to the linear inch.

I intend to test the ores of this vicinity, as to their adaptability to the treatment by lixiviation, and will perhaps give you the result.

CHARLES H. AARON.

Lone Pine, Inyo Co., Jan. 23, 1868.

The Melones Tellurides.

NEW HAVEN, Conn., Feb. 15, 1868.

GUIDO KUSTEL, Esq.—Dear Sir:—I have been much interested in your notice of the silver-gold tellurides from the Melones mine, Carson Hill. I was not before aware of your description given in 1865; if I had been, I would have made reference to it in my catalogue of California minerals. You will observe that I there placed the mineral with doubt under *Tetradymite*, but stated that it had a tin-white color, and was not foliated, and that its specific character was undetermined. I then had but a small sample, and afterwards obtained more which was reserved for an analysis. I have now repeated some of your tests and find them very interesting, especially the experiment of heating a fragment of the silver-gold telluride on a coin, and thus causing the gold to exude from and coat the surface while at a temperature far below the melting point. This is one of the most interesting mineralogical phenomena I have ever seen, and is very suggestive metallurgically.

I am inclined, with you, to regard this as a new species, though its composition, as you have determined it, is nearly the same as *Petzite* from Nagay, Transylvania, analyzed by Petz. He found a little over eighteen per cent. of gold, and gives the gravity as 8.72 to 8.83.

The tin-white mineral which you refer to native tellurium, I find has a cubical cleavage and contains a notable quantity of a soft malleable metal which I suppose to be lead. Its physical characters are the same as in *Altaite*. The quantity which I have here is not sufficient to enable me to make an extended investigation. Yours very truly,

W. P. BLAKE.

The *Petzite* cited by Prof. Blake has the following composition:

Petzite.—Tellurium, 34.98; silver, 46.96; gold, 18.26; gr.=8.7-8.8.

Silver-Gold telluride from Melones.—Tellurium 35.40; silver, 40.60; gold, 24.80; gr.=9-9.4.

These two minerals are very near the same, only the amount of gold is considerably higher, and in consequence of this also the specific gravity.

I cannot now decide whether the white mineral which occurs in the ore of the Melones mine, and of which I had only a very small fragment, contained lead; or whether the lead reaction might not have been due to the small quantity operated upon; but since observing the above remark of Prof. Blake, that he found a notable quantity of a malleable metal therein, I have obtained as much of it as was necessary for a blow-pipe examination, and found the reaction, in all particulars, exactly like telluride of lead, which it doubtless is. The mineral is tin-white, with a greenish tint, and shows no trace of silver or gold. G. K.

LEGISLATIVE ANNUNCIATOR.—Dr. A. W. Hall, of New York city, has invented an apparatus for taking the votes in legislative bodies. It is fixed upon the clerk's desk, and from it a wire leads to the desk of each member. When the "yeas" are to vote, the clerks slip into the apparatus a piece of paper containing the names of the members in the proper order, and having the word "yea" printed at its head. Upon the calling of the vote, each member actuates his wire, and a puncture is thereby made at the end of his name. The "nays" are recorded in the same manner. Any number of slips may be placed in the box, and all punctured at the same time. Each of these is a complete record of the vote. The apparatus is all contained in a case about four feet long by one foot in width.

CARBOLIO ACID AND CREOSOTE.—H. Rust gives two methods of distinguishing these from each other. Collodion and carbolic acid when mixed form a gelatinous mass. True, creosote and collodion, on the contrary, form together a clear solution. Another test is a solution of perchloride of iron to which sufficient ammonia has been added to form a little permanent precipitate. Carbolic acid added to this mixture gives a blue or violet coloration; creosote gives a green color which turns to brown.

Mechanical.

CONDENSATION IN STEAM ENGINE CYLINDERS.—The *Engineer* has an article upon this subject, suggested by a patent suit in which the testimony given plainly showed the fact that a remarkable degree of ignorance existed, even among practical engineers, upon the subject. We condense from the article as follows: Those who have studied the subject of steam engine economy, with a knowledge of the phenomena of heat and its conversion into work, are aware that the theoretical advantages of expansion cannot be realized in practice because of the condensation which takes place within the cylinder. This is due to radiation from the external surface, convection into the condenser or the atmosphere through the exhaust, and what has been termed "internal work" done on the particles of water composing steam. In all cases the principal source of loss of heat is found in the frigorific influence of the condenser, and is in ordinary double-acting engines absolutely unavoidable. Careful experiments should have been long since conducted with a view to determine by practical trial what weight of water was actually condensed in the cylinder of any given engine. Strangely enough, however, no such inquiry has been carried out. Maximum economy cannot be reached until condensation is absolutely prevented in the cylinder or the jacket. We do not here allude to the condensation which is due to internal work, but to the condensation which results from the continued changes in the temperature of the cylinder itself. Whether a highly non-conducting material will ever be produced suitable for lining cylinders it is hard to say, but it cannot be doubted that the use of excessively thin steel cylinders, surrounded by a steam jacket or carefully clothed, would tend to economize fuel. A cylinder might be made of steel not more than one-sixteenth of an inch thick, fixed inside another of cast iron with a space of a couple of inches intervening, this annulus to be filled up with some non-conducting material forced in sufficiently hard to afford support to the inner cylinder. Paper would answer very well. The steel lining would only be required to provide for the wear of the piston. Those who have seen what paper becomes under a pressure of twenty or thirty tons per square inch, will understand how easily it could be used in this way.

HARDENING AND TEMPERING STEEL.—A New Jersey correspondent of the *Scientific American*, expresses decided doubts as to the assumed advantages of baths or pickles for hardening steel. He believes that oil for very light articles, and pure water for the heavier, are better than any pickle of salts, etc. Dies for a press, with a hole inside, should be hardened by two streams of water coming from opposite directions, and meeting in the hole. The journal concurs in this opinion, and says that a great deal of *bosh* is written and believed by mechanics upon the subject;—that verbal instructions in regard to hardening and tempering steel are of little use to the steel worker, but that experience and practice are absolutely necessary.

RECUITING FILES WITH ACIDS.—A recently patented process is as follows: "The files are cleansed with warm water containing a little potash, then washed and dried. A pint of warm water is now put into a wooden vessel, and in it as many files as the water will cover. Two ounces each, of pulverized blue vitriol, and borax, is now added, and the files turned over, so that both sides may be brought in contact with the mixture. Seven ounces of sulphuric acid, and one-fourth of an ounce of cider vinegar, are now put in. The files will become red, but after a short time will resume their natural color. They are then taken out, washed with cold water, and dried. After being sponged with olive oil, they are wrapped in porous brown paper, and laid aside for use."

STEAM PACKING.—J. A. Miller makes steam joints tight by placing a thin sheet of muslin between the flanges of the pipes which are previously painted. The muslin is a receptacle for the paint, holding it in place and preventing the steam from blowing it out, which is usually the case, when paint alone is used. The paint preserves the cloth and thus makes a permanent packing.

HAND TURNING TOOLS VS. FILE FINISHING.—We observe with regret that the use of hand turning tools for iron is being discarded by American mechanics, and that there are many machinists who know little of the use of such tools. For some time after the introduction of the slide-rest, hand turning tools were extensively used; but as the use of that attachment to the lathe extended, in like proportion did hand tools become excluded from the workshop. In trimming turned swells and beaded work, as on the heads of steam cylinders, and in finishing off rounds, corners, angles, and plane surfaces, no better instrument can be used than the diamond-pointed hand tool. To reduce metallic surfaces where but little material is to be removed, and also to finish the work of the slide-rest tool, the file presents the readiest means, as it requires no change of the parts of the lathe. As a consequence the file is often brought improperly into requisition. It is barbarous enough to finish counter-shafts with the file so that the pulleys can be placed upon them, but when it comes to finishing the journals of such shafting by that means, our indignation finds no words to vent itself.—*Artisan*.

IMPROVEMENT IN STEAM GENERATORS.—At the meeting of the Polytechnic Association of the American Institute, Jan. 30th, Dr. H. N. Barbour proposed a new plan for the construction of steam generators, based upon the fact that a flame will not pass through fine wire cloth, the heat being absorbed. If these wires were iron tubes, the heat would be as readily absorbed by them. His plan is then to place a large number of small tubes in a horizontal position immediately over the fire, and so near together that the heat will be absorbed, the same as in the wire gauze. One end of these tubes is bent so as to stand vertically, and these ends are inclosed in a drum in which steam is generated by the heat given off from the tubes, which are hermetically sealed and in close a small quantity of water. The maximum of the heated pipes is the temperature of the water in the drum. As condensation is more rapid than absorption of heat, a constant circulation is kept up in the tubes, and that temperature as given to the water in the drum is the most productive of steam generation.—*Artisan*.

CRANK-PIN JOURNALS.—There are two things required of a crank-pin journal, viz: the diameter necessary to secure the requisite strength, and a sufficient area of rubbing surface to prevent undue heating.

The proper area of the circular cross section of the journal of a crank-pin, to simply resist the force transmitted to it by the connecting-rod, can be found by dividing the total pressure on the piston by 2,500; and the diameter corresponding to this area will be that proper for the journal.

The remaining point is the area of rubbing surface necessary to prevent heating. The heat generated by friction has been experimentally determined by Joule to be equal to one thermal unit for every 772 foot-pounds expended in producing friction. In the case of a crank-pin journal, the number of foot-pounds expended in producing friction per minute is equal to the product of the number of revolutions per minute of the journal (one for every revolution of the engine) multiplied by the circumference of the journal in feet.—*Artisan*.

MAKING CHAINS WITHOUT WELDING.—A French patent has been taken out for the manufacture of chains without welding the links. Each link is made by punching a hole in a disc of iron, making a flat ring, which is then spun into a round one on rollers, arranged for the purpose. This ring is then drawn out into a long hoop, pressed together in the center, and doubled upon itself. The links thus formed are then interlocked. For cables, this invention seems especially adapted.

STEEL HOOPS.—Messrs. Taylor Brothers & Co., of Leeds (England), have just completed some very large cast steel hoops, which are ten feet six inches in diameter, six inches broad, and one and seven-eighths inch thick. These hoops have been made from solid cast steel ingots, which, after hammering, were rolled in a tire machine.

LOCOMOTIVE BOILER TUBES.—The composition of the material for locomotive tubes, where coal is used, is a matter of importance. Hitbeto it has been very various. Mr. George A. Everitt, of Birmingham, in a communication to the London *Artisan*, gives it as his opinion that the tubes should be of brass, of which seventy per cent. should be copper.

Scientific Miscellany.

Occlusion of Gases by Metals.

Mr. Graham has shown that the remarkable property observed by Deville, in platinum and iron, of permeability to hydrogen at a red heat, is possessed also by palladium, and that at a much lower temperature. At 265°, there is a steady passage of hydrogen into the interior of an exhausted tube of palladium, when surrounded by coal gas; the other constituents of the gas being excluded by the metal. This transmission is altogether different in character from transmission in general by transpiration; and is dependent upon some special relationship between the gas and the metal. It is preceded by an absorption or occlusion of the gas in the substance of the metal. Platinum wire, drawn from the fused and solidified metal, was heated to redness and allowed to cool slowly in an atmosphere of dry hydrogen gas. After cooling, and exposure for some time to the air, it was placed under a porcelain tube, which was then exhausted of air, and afterwards heated to redness. The iron gave off 21 per cent. of its volume of hydrogen. This was shown by experiments, not to be due to the extent of surface. Spongy platinum absorbed and delivered 148 per cent. of its volume; and a form intermediate in density,—ordinary wrought platinum,—gave 476 per cent.

Foil of wrought palladium, raised to the temperature of 245°, and then cooled slowly in a current of hydrogen, evolved, when afterwards heated *in vacuo*, 52,600 per cent. of the gas, a quantity equal to 526 times its volume. When kept at a temperature of between 90° and 97° for three hours, and cooled for an hour and a half, it absorbed 376 times its volume, provided it had been recently ignited *in vacuo*. These experiments show that palladium is altogether peculiar, in its relations to hydrogen.

Copper wire, thus treated, will absorb 30 per cent.; gold, in the form of assay cornettes, 48 per cent., together with some other gases. Silver wire absorbs oxygen in preference; taking up, at a red heat, 74 per cent. of that gas, and 21 per cent. of hydrogen. Iron specially absorbs carbonic oxide, taking up when in the form of wire, 415 per cent. of that gas, and 46 per cent. of hydrogen.

From the small volume occupied by these gases when thus occluded, it is probable that they are in a state of liquefaction, although among those which have never yet been liquefied by direct pressure; or, at any rate, that they are no longer in the gaseous state.

STEREOSCOPIC NOVELTY.—A "real image" stereoscope has been produced in Paris. In the ordinary stereoscope, the observer places his two eyes opposite two lenses, and sees the virtual image of two pictures apparently at the same place. In the "real image" stereoscope, the observer stands about two feet from the instrument and looks at a frame containing a single large lens. He then sees—just in front of the lens—a real and inverted image of each of the two pictures, the union of which forms the appearance of a solid figure or "ghost" in the air, between himself and the apparatus.

NEW METHOD OF REFINING ALLOYED GOLD.—F. B. Miller, an Australian assayer, has patented a process for this purpose. In his specification the patentee proposes the employment of chlorine gas or hydrochloric acid gas, applied in such manner that it shall rise up through the alloyed gold in a molten condition, by which means the chlorides of silver and of any other metals of baser order which may be present, will be formed and will rise to the surface of the melted mass, while the gold will remain beneath in a purified and tough condition.

SULPHUR.—By adding to pure sulphur a four-hundredth part of chlorine or iodine it becomes very soft, so that it may be spread in thin leaves as flexible as leaves of wax.

PRECIPITATION OF COPPER AND NICKEL

BY ALKALINE CARBONATES.—W. Gibbs, in a communication to the London *Artisan* on this subject, says that the precipitation of copper by zinc, or the electrolytic method, although suited to cases where the metal is present as a chloride or sulphate, does not succeed with the nitrate. He has found that copper may be completely precipitated by the alkaline carbonates from the nitrate, as well as the sulphate or chloride solution, if the solutions are boiled for a sufficient time, and are sufficiently dilute. The solution should be diluted with water until it contains not more than one gramme to the litre. A solution of carbonate of potash or soda is then added in small excess, and the whole boiled half an hour. The blue-green carbonate becomes dark brown, and is granular. After washing, it is ignited with great care, in an atmosphere of hydrogen, and the copper weighed. The small portion of the oxide or basic carbonate which adheres to the sides of the vessel in which the boiling is performed, is to be redissolved and precipitated; but care must be taken not to add a large excess of the alkaline carbonate. Nickel may be precipitated by the same process. Cobalt can be precipitated in this way only by long boiling. Both of these last may be precipitated from neutral solutions of their sulphates, nitrates, and chlorides, by adding first an excess of oxalic acid to the concentrated solution, and then a large excess of strong alcohol. This method fails when salts of ammonium, or of the alkaline metals are present. The oxides of copper, cadmium, zinc, manganese, and magnesium, are also completely precipitated from their sulphates by oxalic acid and alcohol, but not in the presence of alkaline salts. The same is true of both mercurous and mercuric nitrates. It will probably be best to determine the oxalic acid, in the oxalate, by hypermanganate of potash.

BROMO-IODIZED RUBBER.—Rubber and other gums may be hardened without sulphur, by combining them with a mixture of iodine and half its weight of bromine. Proto-bromide of iodine is formed. Rubber so prepared will harden on being subjected to a heat of 250 F. for an hour. The bromine and iodine are each previously treated with oil of turpentine mixed with one-fourth its weight of sulphuric acid,—on account of the volatile nature of proto-bromide of iodine. Three ounces of the pasty mixture is required for a pound of the gum. The process is patented.

PREVENTION OF DANGER FROM LEAD PIPE.—The action of distilled water upon lead is said by Böttger to be due to the presence of carbonate of ammonia. Distilled water, after active ebullition, will not attack the lead until after a considerable exposure, when a reabsorption of ammonia and carbonic acid, which are always present in the air, may be supposed to have taken place. When water is examined for its action on lead, Böttger points out that pure lead must be used, for the presence of a small amount of tin will prevent any action from taking place. This fact suggests the employment of lead alloyed with a small amount of tin for water-piping and cisterns.

ADULTERATION OF DYES.—A correspondent of *The London Chemical News* says that common salt holds a prominent place among the substances used to adulterate chemicals for dyeing. It is well known that to dye an even, fast and brilliant shade, the coloring matter must be held in a state of perfect solution,—or if insoluble, in the finest possible suspension, so that it may be slowly and gradually delivered to the fiber. Now the presence of salt impairs the balance between the solvent and the color, and causes the latter to be rapidly and irregularly deposited on the surface of the goods, in a dull state capable of easy removal. Ground turmeric is another article often mixed with salt, which imparts to it a brighter appearance in the state of powder; and the action of the salt in this case is very similar to what has been previously described.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand new and important inventions; also, the list of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

74,043.—SAFETY HOOK.—E. F. Brundate, Virginia City, Nev., assignor to himself, Wm. T. Eaves, and Wm. Eaves.

I claim the collar C, fitted on the swivel stem B, and provided with notches or recesses, *i k* in its under side, in combination with the hinged part *e* of the hook, and the projection *j* on the upper part *b* thereof, all arranged substantially as and for the purpose set forth.

74,073.—SEEDING MACHINE.—Olney Fry, Jr., Albany, Oregon.

I claim 1. The combination of the gear-wheel N, attached to the drive-wheel A, pinion-wheel M, shaft L, crank or crank wheel K, connecting-rod J, and lever I, with each other and with the seed-box E and adjustable sliding bar F, said seed-box and sliding bar being constructed and arranged substantially in the manner herein shown and described.

2. The combination and arrangement of the sliding bar P, connecting-rod R, and lever S, with each other and with the shaft L, substantially as herein shown and described, for the purpose of throwing the pinion-wheel M into and out of gear with the gear-wheel N.

3. The combination of the posts T, cross-hairs U, longitudinal bar V, beam W, plow-standards X, bar Y, and draught-bars or rods Z, with each other and with the frame D and tongue C, said parts being constructed and arranged substantially as herein shown and described, and for the purpose set forth.

4. The combination of the keeper C, lever A, spring E, and notched standard with each other and with the longitudinal bar V, substantially as herein shown and described, and for the purpose set forth.

74,281.—APPARATUS FOR WASHING GOLD ORE.—Seth L. Beckwith, San Francisco, Cal.

I claim 1. The device for imparting to the pans E F G the peculiar swinging motion used for separating metals when only mechanically mixed, by hanging them to rotating upright crank-shafts, in manner substantially as and for the purposes above set forth and described.

2. The pan E, provided with a double bottom, whereof the upper one is arched and perforated, and the lower funnel shaped in manner substantially as above set forth and described.

2. The pan F, divided into chambers, substantially as above described, the walls whereof are crowned by overhanging ridges, *b*, in manner substantially as above set forth and described.

74,547.—IMPROVEMENT IN THE CONSTRUCTION OF SEA WALLS.—John Kelly, San Francisco, Cal.

I claim the strips or lead A C, when placed between the joints of blocks of masonry, substantially as and for the purposes herein specified.

This invention relates to an alleged improvement in the building of sea walls, so that the action of water against them will not wash out the mortar or cement from the seams or crevices between the blocks of masonry. It consists in placing strips of lead between the blocks; but only along the outer edges, as the walls are built up. Back of these strips the mortar or concrete is filled in as usual—the lead in front acting as a shield to protect the mortar from being worn away by the action of the water. A common method heretofore adopted has been a placing in front of the mortar strips of cloth dipped in asphaltum. This device has been found ineffectual, as the continual action of the water soon wears away the protecting medium, after which the more yielding mortar in cement begins to yield to the same face of the wall. This invention, it is thought, will be especially serviceable in the construction of the walls of stone dry docks and other walls where it is desirable to prevent leakage.

74,562.—NEWSPAPER FILES.—Louis P. McCarty, San Francisco, Cal.

I claim a newspaper file, constructed substantially as and for the purpose herein described.

The object of the invention is to construct a cheap, durable and ready file for preserving newspapers in their chronological order, which is effected by bending a wire upon itself so as to form two parallel sides, between which the papers are laid and secured, the file being clasped at one end, and having the other coiled so as to form a

spring for opening it. For ready reference, a hook may be placed in the wall above the desk, and the ring of the file be placed over it, while a piece of elastic cord may be fastened to the desk, and hooked into the coils, thus extending the file at an incline in front of the person at the desk, when the whole file may be readily run over without trouble or delay.

73,599.—IMPROVEMENTS IN BOOTS AND SHOES.—Evan T. Rogers, San Francisco, Cal.

I claim making the ridges on the markers by casting them in one piece with the plate, substantially as described.

The nature of this invention is to provide an instrument for marking the counters and straps to boots and shoes, so as to enable the sewer to follow the marks; and consists of a piece of metal, of the desired size, having ridges upon its face of the desired angles.

California Academy of Sciences.

REGULAR MEETING.

MONDAY EVENING, March 16, 1868.

President Whitney in the chair. The President read a communication from J. W. Foster, of Chicago, giving an interesting account of a stone implement received there recently from California. The material is syenite, very much like the Quincy granite, symmetrical in shape, not quite circular on the cross section, ground and polished so as to exhibit in marked contrast the pure white of the feldspar and the deep green or black of the hornblende. The blunt end is pierced with a hole, whose outer edges are rimmed out, so that it looks very much like a plummet. It was found in digging a well, thirty feet below the surface, on or near the premises of Lafayette Nealy, in the town of Woodbridge, San Joaquin County, about eleven miles from Stockton.

After the reading of this communication, which was accompanied by a drawing of the object, considerable discussion ensued relative to similar objects known to have been found in this State, and to the habits of the Digger tribes, who seem to have advanced no farther than the stone age.

In connection with inquiries on the early records of the human race in this State, Professor Whitney stated that he was preparing a paper giving new light on the famous Calaveras skull. He also exhibited a fossil sent to the Geological Survey by Roger S. Day, a rare species of ammonite, apparently, found in a hill-top in the mines seven miles east of Folsom, and interesting for the additional evidence it presents of the secondary age of the California gold formation.

Dr. Kellogg exhibited specimens of several rare plants found in this vicinity, including a peculiar lilaceous plant.

Dr. Bolander presented to the Academy a large collection of ferns and grasses, including all the California species, about 114 in number. Dr. Kellogg stated this collection could not be gathered *de novo* for less than \$2,000. The thanks of the Academy were voted to the donor, and a subscription of \$40 or \$50 taken up to procure a case for its proper care and disposal.

Acknowledgements of the receipt of the Academy's *Memoirs* were received from the Smithsonian Institute and other scientific sources, and the letters contained high praises of the matter and typographical execution of the *Memoirs*.

A long, rambling discussion on hotanical subjects closed the session. Dr. Bolander, on a hint from Mr. Bloomer, suggested the making of a catalogue of all introduced plants about San Francisco, both for its interest as showing the character of our climate and for its future historical value. He had observed that all the plants which have naturalized themselves in California are of Mediterranean origin. Dr. Kellogg here spoke of the ready adaptability of our soil and climate to Mediterranean products, owing to similarity in native conditions. Dr. Gibbons commented on the favorableness of our dry soil and climate to the preservation of seeds and continuous propagation of plants. Dr. Bolander, in reply to Dr. Cooper, stated the mode of determining if plants are introduced or native by a reference to the harmonious relations of botanical divisions. There was also some talk on the old theory of spontaneous production, which was maintained stoutly by Mr. Bloomer, who incidentally threw out the idea that Darwin had clouded the question of the origin of species by confounding species with individuals.

By common consent of the Academy, the Council will make arrangements for an early field meeting to investigate some of the shell mounds in this vicinity for Indian relics.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, }
March 21, 1868.
CITY STOCKS.

The open market is almost bare of transactions, and the amount changing hands privately is very much restricted. San Francisco Gas stock sold uniformly during the week at \$70. State Telegraph again made its appearance, selling at \$30. San Francisco Insurance stock may be had at par. At the annual meeting of this company, held on the 17th inst., the old officers were re-elected—Geo. C. Boardman, President, and P. McShane, Secretary.

The stockholders of the Spring Valley Water Company, at a meeting held on the 18th inst., decided to increase their capital stock from \$6,000,000 to \$8,000,000, the same to be ratified by two-thirds of the stock, which has been done. The distribution of the new stock—20,000 shares—will be made upon the basis of \$58 per share, which will entitle each stockholder to one share for every three now held. It is proposed to call in the additional stock as follows: 40 per cent., or \$23 20 cash, 30 per cent., or \$17 40, in sixty days, and 30 per cent., or \$17 40, in six months. Early in the week, a few sales of this stock were made at \$60; at the close held higher.

The receipts of the local insurance companies during the months of January and February, 1868, according to the returns made to the Internal Revenue Department, have been as follows:

	January.	Feb'y.	Total.
Pacific.....	\$65,439	\$43,423	\$108,862

The returns were made upon a legal tender basis, the rate—72 cents for January, and 71 cents for February—being fixed every month by the Assessor of the district.

The above statement shows a gain over the receipts in January of \$6,444. The receipts of the several companies in February, as compared with January, show the following difference:

	Increase.	Decrease.

Market Street.....	5,400	6,127	11,527
Potrero and Bay View.....	986	1,616	2,602

Total.....\$37,601 \$39,038 \$76,639
An assessment of \$5 per share was levied on the capital stock of the Potrero and Bay View Railroad on the 16th instant.

We notice that savings and loan institutions are being established at many of the more important interior towns. The one recently incorporated at San José will probably go into operation on the 24th inst. The existence of these places of deposit is in itself the guaranty that the people have something more than their daily needs call for, and that they exhibit both thrift and economy. At Stockton, articles incorporated the San Joaquin Valley Bank, were filed in the office of the County Court of that county a week ago. The capital stock is to consist of \$200,000, with the right to increase it to \$500,000, and is now divided into 2,000 shares at \$100 each. Its term of existence is limited to fifty years. The institution will be managed by nine trustees, for the first three months of its existence. For this purpose the following Directors were chosen, viz: G. B. Claiborne, B. W. Bours, James A. Crow, R. C. Sargent, Henry S. Austin, H. O. Mathews, George Gray, Anstin Sperry and John C. White. The principal place of business of the company is the city of Stockton.

Mining Share Market.

The mining share market has obtained an activity and advance little thought of by the best informed but a short time since. This is more particularly true of the Gold Hill mines, embracing the ground covered by Crown Point, Kentuck and Yellow Jacket companies, and should the ground north of this locality, through the Imperial-Empire shaft, give promises of fair discoveries, that locality will reach greatly enhanced prices, and also tend to appreciate claims still further north.

Intelligence from the mining region is very meagre, and unsatisfactory, because of the difficulties in the way of communication. Our roads still remain almost impassable, requiring the expenditure of much time and labor to pass from

one point to another. The values of stocks are always subject to greater changes when communication between the places of their existence and the place of purchase and sale is difficult and occasional; and are always more steady and reliable when such communication is regular and uninterrupted. Were it not for the telegraph the money dealers of this coast would scarcely undertake to venture largely on the fluctuations of the stock and gold market, and a business amounting to many millions a year would have remained a sealed book to our brokers.

The time of holding the annual meetings of the various mining companies have considerable influence in stock operations, and we have, herewith tabulated the dates, so far as at present ascertained, for general reference:

Gold Hill Quartz M. & M. Co.....	Second Monday in January
Sierra Nevada.....	Second Monday in January
Amador (Cal.).....	Third Monday in January
Danoy.....	First Monday in March
Hale & Norcross.....	Second Wednesday in March
Crown Point.....	First Monday in June
Imperial.....	Last Tuesday in June
Chollar-Potosi.....	Second Monday in July
Overman.....	Fourth Tuesday in November
Yellow Jacket.....	Third Monday in July
Savage.....	Third Thursday in July
Segregated Belcher.....	First Tuesday in October
Empire.....	Second Monday in October
Exoholquer.....	Third Tuesday in October
Confidenco.....	Second Friday in November
Kentuck.....	Fourth Wednesday in November
Ophir.....	Third Wednesday in December
Gould & Curry.....	Fourth Monday in December

CROWN POINT—experienced a very marked advance during the period under review, rising from \$1,740 to \$2,500, and closing at \$2,360.

A telegraphic dispatch of the 20th, states that they have found six feet of \$36 ore on the 800 level, and that the winze from the 700 level is down forty-eight feet, looking as well as reported.

IMPERIAL—has been in fair request, advancing from \$260 to \$272 50, and closing yesterday at \$267 50. The receipts of bullion for March account are reported at \$23,577 27. About 80 tons of ore is the daily product of the mines. The 371 level continues to look well, and the "west body" is said to show no change. In the lower drift from the shaft they have made considerable progress, and the first set of timbers, five feet from the shaft, have been placed.

KENTUCK—was largely dealt in toward the close, having rapidly advanced from \$287 50 to \$410, and closed at \$420. The receipts for February account foot up \$54,174 75, and it is thought will reach \$70,000. The 500 and 700 levels continue to look well.

YELLOW JACKET—has been in moderate request, steadily rising from \$1,150 to \$1,440, falling to \$1,365, then selling at \$1,550, and at the close realizing \$1,490. It is reported that quartz has been obtained in driving toward the 700 level of the Kentuck company, containing good pay ore.

CHOLLAR-POTOSI—opened at \$230, receded to \$224, rose to \$275, and closed at \$269. During the week ending March 12th the ore product amounted to 219½ tons against 170 tons the previous week. The north end of the old Santa Fé level yielded a few tons of good ore, and the south drift on the Blno Wing station shows a change in the color of the quartz, but not in value.

OVERMAN—declined from \$180 to \$170, rose to \$182 50, and closed at \$178. Since our last issue \$14,517 62 in bullion have been received. Some of the ore recently reduced was of December product.

ALPHA—rose to \$1,540; but was recently consolidated with the Treglone company, consisting of 6,000 shares, at a par value of \$250 per share, equal to \$1,500,000 of capital stock, and at the close sold at \$78 ¾ sh. Thomas Bell, Wm. M. Lent, Thos. Sunderland, Wm. Sharon and Louis Gerstel are the Directors. The office is located at 705 Montgomery street.

AMADOR—at the close sold at \$300. The second dividend of \$6 per share for the month of March was disbursed on the 18th inst.....

OPHIR sold at \$175@196, and closed at \$200. A telegram of the 20th states that work is progressing finely at the new shaft.

SAVAGE—receded to \$145, rose to \$173, and closed at \$162. Owing to the inclemency of the weather no advice of a late date have reached the office in this city....HALE & Norcross was in the market at \$2,800@2,730. No late news of any importance from the mine.

The sales in the Board during the past week have been as follows: Regular sessions, \$2,338, 597; open sessions, \$603,683—total, \$2,942,280.

PAPER BELTING.—The experiment of making belting from paper has proved a success in the hands of Crane & Co., at Dalton, Mass., and the article is now used in all their own mills, and several other manufacturing establishments. The belting resembles the genuine oak tanned leather, and serves alike well in a dry or damp atmosphere.

CONTINENTAL Life Insurance Company 302 Montgomery street, corner of Pine.

THE SINK OF HUMBOLDT.—A station keeper at the sink of Humboldt, thinking to find good water by sinking below the water level of the lake, procured an artesian auger and bored down 90 feet through compact earth, when the auger suddenly dropped into a soft substance that yielded so readily as to enable one man to push it down to an indefinite depth by simply bearing his weight on it. When it was drawn out, it brought with it a sulphurous stench. The project was abandoned, and now the denizens dig an ordinary well thirty or forty feet deep, take water from the slough, and hang it in the well to cool.—*Omaha Avalanche.*

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Chronicle, March 7th: During the past week, rumors to the effect that a rich ledge of silver-bearing ore has been struck in the tunnel of a well-known claim within a mile of Silver Mountain, have been current in this vicinity.

We have it from a pretty authentic source, that the Pittsburg Co. have struck good ore in their mine up Scandinavian cañon; so good, that Mr. Thompson, feeling confident of immediate need of a mill, has gone over the mountains to negotiate for the Whiteside mill.

Amador County.

Dispatch, March 14th: The proprietors of the Coney & Bigelow mine are adding more stamps to their mill—will start up again next week. The shaft is now down over 260 feet, and still sinking; disclosing a fine vein of nine feet in thickness. The force on the shaft has been doubled.

Two hundred tons of ore from the Kennedy mine is now being delivered at the Coney & Bigelow mill for crushing.

The Casco mine has in the south drift a vein of eight feet, and in the north drift one of three feet. They are now hoisting large quantities of rock. There is another vein of rock about 30 feet east of their present shaft, toward which a drift is now being made. This vein was found by means of a tunnel which was run on the eastern declivity.

Ledger, March 14th: The yield of the sulphurets saved at the Coney & Bigelow mine for the month of February, amounted to the sum of \$3,500. These sulphurets are worked by chlorination process, at trifling expense, and add largely to the earnings of this mine.

Placer mining is not yet "gone in." More good strikes have been made the present season than for some winters past. The owners of a claim at Clinton (owned we believe by Spagnoli & Pitcher) picked up over 900 pounds of nuggets since they began work at the beginning of the rainy season. This same ground has been pronounced worthless since 1850.

The same paper has an editorial, urging the absurdity of the present high rate of wages, and suggesting, that if it was reduced, many mines now neglected might be profitably worked, and that no class would be a greater gainer by the change, than the one which now thinks that it would be the loser.

Calaveras County.

Chronicle, March 14th: Labor is now being vigorously prosecuted at a number of placers on lower Rich Gulch. The first claim on the vein, at the upper end of the gulch, is that of the Plomo Mill and Mining Co. When the rains commenced last fall not a pick had been struck in the lead at this point, and not a move made towards the erection of machinery. At the present time quartz is being taken from the vein from shafts and a tunnel; an 8-stamp mill is pounding out the precious metal night and day; quite a village has sprung up, and the gulch presents a lively and business like appearance. The battery consists of eight stamps with a combined weight of 4,800 lbs. The stamps are run at the rate of 80 strokes per minute. Its crushing capacity is from 80 to 100 tons per week. The tunnel, situated directly above the mill, has been driven 60 ft. on the lead, which is fully six ft. in width. The rock looks and prospects extremely well. Gold is plainly visible in the rock in the end of the drift. Two shafts are being sunk, one of which has reached the depth of 60 ft. and the other 25 ft. Alexander & Co. are running their mill constantly and meeting large returns. Norton & Co. below them on the same lead, are already in 140 ft. with their tunnel, and pushing it ahead night and day. They expect to reach the vein in a month, when they will be 200 ft. beneath the surface.

Letter from Mokelumne Hill: In the Quartz Glen (or Foote & Thompson) mine, the present owners have driven a tunnel on the vein for a distance of 650 ft., making a back between the level of the old works and tunnel of 176 ft., and it is 300 ft. perpendicular from one level to the ravine or lower point of the claim. Rock from the old works, packed on animals to the French mill, one year ago, paid \$76 per ton. South of the claim is the French mine. The mine was worked to a considerable extent, with fine prospects, but as the mine belonged to one party and the mill to another, they disagreed, and in consequence are both idle.

The next the Anglo Saxon mine, a half mile east of the Quartz Glen, is the same

that created so much excitement in 1856, by the extraordinary richness of the rock; since then there has been a large amount of work and money expended. The developments consist of three shafts, one of which reaches the water level of the vein. It is in this shaft that the last work was done. Rock last fall worked in the French mill, paid \$10, while the sulphurets assayed \$600 per ton.

There is a level run from the bottom of this shaft 32 ft. The vein here is three ft. in thickness, and richer quartz than this appears to be is hard to find.

Register, March 14th: Mr. Irvine's deep claim is reported as looking better than it has ever before; and that Ben Thorn's quartz vein increases in width and richness as they sink upon it. The extensions of the Ben Thorn vein have been worked to some extent with most flattering prospects.

Nevada County.

Transcript, March 14th: The claims of Wm. Nichols, at Columbia Hill, have been purchased by a San Francisco company.

Same, 17th: Dr. Farnham's company commenced washing at Chalk Bluff yesterday morning. This company has run into the hill 300 ft., sunk a shaft, and have now commenced washing in an excellent bed of gravel.

Gazette, 11th: The Gougeye, Eastern and Empire (cement mills) at Hunt's Hill, are all running regularly and doing well. Each one of these mills employs eight stamps. Good miners are scarce at this mining camp, and fifteen or twenty good drifters and carmen can find steady employment there, and pay every week if they desire it.

Thomas Marker, who came down from Washington on Monday, reports but very little mining being done in that place or Omega. Ditches and flumes have been severely damaged by the heavy floods. The miners labor under a serious inconvenience in both of these towns for the want of lumber to repair flumes, and on account of the great depth of snow there is no prospect of their being able to obtain a supply before May or June.

17th: A gentleman from Moore's Flat, yesterday, informs us that the snow at that point is four and one half feet deep. At Snow Tent, it is ten feet, and at Eureka eleven feet deep.

Grass Valley National, March 11th: We are informed by a gentleman from Rough and Ready district, that the quartz recently struck by Arhorgast & Co., continues to yield rich prospects. The ledge is about 300 yards south of the head of Oceola ravine, and is about two feet in average thickness, composed of three strata of decomposed quartz. We are informed that \$3,000 have been taken from it in panning out the decomposed quartz and dirt, which prospects from 50 cents to \$6, and up to three and four ounces in occasional pans. The owners are now running a deep cut in the face of the hill to reach the ledge. The old Oceola ledge is to be worked this season. The company intend putting on machinery. Hawes & Co., on Goshen Hill, near Rich Flat, in hydraulic claims, are averaging from \$5 to \$6 a day to the hand. Barker & Rix are working hydraulic diggings at Grub Creek, near Oceola ravine, and are said to be making money. The Vial Brothers of Grass Valley, have been opening diggings on Randolph Hill. They have laid 2,000 feet of iron pipe, and have now flattering prospects of success.

Fritz Jensen, in skirmishing around Wolf Creek, a few days ago, picked up a beautiful specimen, for which he was offered \$10.

Same of 12th: We were shown last evening, some rich specimens from a ledge on the Auburn road, about a quarter of a mile north of the North Star mill, at French Lead. This ledge was taken up some years since by Tarlton & Co., and some work done on it, but abandoned. Michael Hogan and some other parties relocated it under the name of the Irish American Co., a few days since.

Another of the Paine & Stephen's Concentrators is to be put up at the Eureka Co's works.

14th: Work is temporarily stopped at the North Star mine. A few days since the massive crown wheel of the pump gearing unfortunately gave way, and the water in consequence rose so high as to compel the miners to cease work until new machinery is placed in gear and the mine cleared of water.

Excelsior. *Territorial Enterprise*, March 12th: The tunnel connecting with the main shaft of the Mohawk and Montreal mine, situated in Excelsior district, is completed, and ore may now be taken from the lead and transported by means of cars directly to the mill.

Placer County.

Herald, March 14th: We saw a few days ago, some exceedingly rich quartz from the

Buckeye mine, two miles west of Auburn. The rock was obtained at a depth of 80 ft. and was hung together with gold. We learn that the shaft is now down 160 ft., and that five tons of ore crushed at the Golden Rule mill, yielded over \$25 per ton in free gold.

We are told that the Perry, McGonigle Co. claim, on the Black ledge, have purchased a new Cornish pump, and are erecting a whim, and think they will be able, within a week, to drain the main shaft and commence taking out ore again. They have drifted 40 ft. south from the mouth of the old tunnel and struck good prospects.

Dutch Flat *Enquirer*, March 14th: The Dutch Flat shaft has reached the depth of 120 feet. Three shifts are constantly employed, and the work is steadily descending at the rate of two feet in 24 hours. It is thought the bedrock will be reached at from 30 to 40 ft. below the present level.

At Iowa Hill the miners are working steadily descending at the rate of two ft. in 24 hours. The Sailor Union Co. are running off the top dirt of their claim by the acre. Butler & Manuel are at work in the old Rich claims, just below the Sailor Union. The North Star Co. are running a tunnel through the bedrock, to obtain fall for their sluices, preparatory to rigging up as a hydraulic claim. The tunnel is now in 300 ft., and they have about 300 feet more to run. The Jamison Co. are piping away, and are being well remunerated. This claim and the Sailor Union, working as they do from opposite sides of the hill, will in a short time cut the work in two. The Morning Star Co. are running a tunnel to their pay level, the present one being too high for practical use. The mine is paying splendidly.

Sierra County.

Messenger, March 7th: The misunderstanding between the locators and purchasers of the disputed stock in the Good Hope quartz claim has been amicably settled. The title is now perfect, and the claim is one of the best in the county.

Sierraville County.

Yreka Union, Feb. 29th: There is perhaps no mining field now in California that holds out more inducements for the investment of capital than the Klamath River, a stream not merely supposed, but known, to be rich in deposits of gold. We call especial attention to that portion immediately below the mouth of Cottonwood creek. Last fall one company, Shaft & Co., threw in a small wing dam and worked for a few months, and as a result took out, we understand, some \$16,000. The same company will operate again in the same claim this year, but on a much more extensive scale. We understand also that some eight or ten other claims in the same vicinity will be worked.

ARIZONA.

San Bernardino Guardian, Feb. 29th: We have the following items from Mr. Lawhenheimer, who arrived here on Tuesday from La Paz: Mr. Reed has been quite successful with his process for working the sulphurets near Prescott; from a lot of tailings he obtained \$35 per ton; and from the rock he extracted \$95. Smith's claim on the Vulture mine has been opened, and is developing splendidly. The lode now shows rich ore for thirteen feet in width, and they have not yet come to its extent. This claim adjoins the Discovery claim. The Wickenburg mill had been running only two days, but had given entire satisfaction to the proprietors. The Phelps company, on the Vulture, are operating in a systematic manner. The amount of hullion turned out weekly is said to be large. At Weaver, placer mining is still pursued, when the season permits. While the ditch water lasts, the Mexicans keep at work and wash out plenty of coarse gold. Quartz mining here and on Antelope Creek has been abandoned.

Same of March 7th—Letter from Samuel Adams: * * I called at the Planet, Great Central, Springfield and other copper mines about 12 miles up Williams' Fork. A large amount of rich ore was being taken out. I know of no locality where there are greater opportunities for profitable investment than within a circumference of six miles around the Great Central mine. No ore is shipped from this section but will pay \$80 per ton. Yet such is the difficulty in getting facilities to take it down the river, that it is fast accumulating at the mines or at the landing.

COLORADO.

Herald: Warren Hussey & Co. had yesterday, at their bank in Central, a retort of 36.09 ounces of very fair gold, from one and three-quarters cords of ore from the Aurora lode. The shaft in the Munsell lode is now down thirty-five feet. Several specimens have been shown which assay over \$2,100 per ton. Work has been com-

menced on the Bates and Hunter lode. The Galconda lode is being worked. Mining is prosecuted with vigor on James creek.

The *Miner* says the New Boston lode is rapidly progressing. The Georgetown tunnel has reached forty-six feet through a fissure vein.

Denver *News*, Feb. 26th: We were shown this morning, by Mr. John Wood, of Snake river country, a silver brick weighing 154.65 ounces, from ores from different lodes owned by him. The ore was reduced at the United States Branch Mint, in this city.

DACOTAH.

D. K. Allen writes the Montana *Herald* in regard to the Sweetwater mines, as follows: In this whole section of country there are probably not over twenty-five holes down to the bed-rock. Whether there are extensive placer mines here or not, remains yet to be seen. One thing is certain—where there are so many rich leads there ought to be rich diggings. Let no man dare to come here unless he has enough of everything to last him until the 15th of June. Flour is \$20 per sack; bacon, 75 cents; sugar, 75; coffee, 75; tea, \$4 per pound; beans, 25 cents; potatoes, 15; butter, \$1; cheese, 40 cents; eggs, 75; picks, \$7 50, and poor at that; axes, \$6, and everything else at "49" prices, and none to be had at that.

Montana *Post*, Feb. 22d: Reports now come in of the discovery of fabulously rich quartz ledges, and that miners are making from \$5 to \$20 per day by the slow and tedious process of hand mortars. One correspondent states that placer mines of great extent and richness have already been discovered.

Territorial Enterprise, March 3d: Almost daily parties pass through this city for Salt Lake, intending to go from that place to the Sweetwater mines as soon as they ascertain that they can get through the South Pass. The news from the mines is, however, vague—nothing satisfactory.

Austin *Reveille*, Feb. 28th: This morning a train of sixty-one animals was driven out of the city towards the Sweetwater mines, which point it is intended to reach by the way of Salt Lake city.

IDAHO.

Owyhee *Avananche*, Feb. 22d: Last Tuesday work was stopped on the Oro Fino mine and all the men discharged, except enough to continue the shaft in the north works. The principal cause of this suspension is the great disadvantage under which the Company have labored in not having steam hoisting works. It is expected that the work will be resumed in a couple of months. Mr. Gove, the Secretary, has gone to Virginia City for machinery. He will also bring up material for repairing the Morning Star mill.

In the Woodstock, drifting has been going on from the surface north on the ledge and from the main shaft south. In the drift running south, the quartz contains gold visible to the naked eye. In the north shaft is found splendid silver ore. The ledge is becoming softer and easier to work—the same amount of work that formerly used up twenty drills can now be performed with three. Quartz in considerable quantities is now being taken out.

The Whisky boys are busy night and day putting down the shaft on their mine. The ledge, which has hitherto been nearly perpendicular, now dips considerably towards the east.

Trask & Son's new arastra building is now entirely inclosed, and the timbers are being got out for the water-wheel.

Some of the richest looking gold-bearing quartz we have seen in camp was this week taken from the Poorman mine.

A drift is being run north from the shaft on the Potosi mine, instead of south, as we inadvertently stated last week. A very fine character of crystallized silver ore is now being taken from the mine.

We learn that work will be commenced immediately on the Idlewild mine, it having been bonded till the first of August next.

The "Alice Earl" is the name of Judge Watson's new discovery which we mentioned last week. We are informed that the rock (not selected) at the place of discovery assays \$25 per ton.

Same of 29th: In Flint district, work is progressing rapidly on the Rising Star; work is also going on briskly on the Excelsior, which has been bonded to the Rising Star Company. Mr. Leinehan is engaged in sinking a splendid double shaft, five feet by eight, on the Pacific. It is now down 70 feet, with 6x10-inch timbers. Two samples of the ore recently assayed went respectively \$112.49 and \$167.32 per ton, mostly silver. The vein at present is six feet in depth, but broken up.

It is probable that there will be a lawsuit between the Ida Elmore and Golden Charlotte. A compromise was at one time effected

by which a certain number of feet of neutral ground was left between the two claims; but the partition wall has now been broken down, and there is considerable excitement. The Ida Elmore party claim that their mine, and consequently the Golden Chariot, is neither more nor less than the New York ledge.

Idaho City World, Feb. 22d: A party of miners opened the season yesterday on a claim on Bear Run, at the upper end of Montgomery street, and were actively sluicing. We hear that others have started in at different places about here.

Same of 26th: A great many are getting ready to commence operations in mining all about here, and from other portions of the Basin we hear very encouraging reports of early commencement of the season in the gulch and bar claims, and all look for a very prosperous year.

The new mining ground along the route of Ben Willson & Co's Big Ditch, as now freshly extended, will give profitable employment to hundreds of white miners—not Chinamen—on the opening of the approaching mining season.

NEVADA.

Esmeralda.
Aurora Union, March 7th: The Horace Poor ledge, high up on Silver Hill, which has been steadily worked for a year and a half, is in good shape, and has, we are informed, a considerable quantity of good ore on the dump. We may expect before long to hear of a good clean up from it.

Humboldt.
Register, March 7th: The Essex Mill is about ready for ore. On the evening of the 29th of February, the shrill voice of its whistle could be heard for miles around. The first business for this mill is the reduction of one hundred and fifty tons of ore from the Moore mine, after which it will be kept busy on the Essex and Empire mines.

We learn from Christ Lark that he will resume work in a few days on the Rochester mine, with sufficient money to develop it without further delay.

RENSSELAER.

Revere, Feb. 28th: The Timoke, in Lander Hill, is producing extraordinary ore from its deepest workings. The assay of the pulp of two tons which have just been reduced at the Manhattan mill, gave a yield of silver exceeding \$1,000 per ton.

The Florida mine, which never looked so well as at present, either as regards the quality of its ore or the appearance and size of its vein, will produce a fine lot of bullion for the month of February. It has sent 70 tons of ore to Murphy's California mill for reduction, which will be completed on Monday next, the average yield of which will exceed \$300 of silver, coin valuation per ton. This fine ore was extracted from the lowest level, which is 400 feet on the incline.

Some ore from the Murphy mine, of the Twin River Co., was amalgamated in the mill of the company a few days since, after roasting in the Stetefeldt chloridizing furnace. The bullion was found to be .880 fine; while the proportion of gold was about six times greater than in the same ore roasted in reverberatory furnaces.

Some of March 3d: For several days we have heard rumors of the discovery of gold placers in the southeastern part of the State, and the organization of a district named the Breyfogle, located by rumor near the notorious "Death Valley." The reported placers are said to have been discovered by a party of men from Owen's River Valley, who were prospecting the country lying to the eastward, and were rewarded by finding rich placers about 150 miles east by south from Fort Independence. The gold occurring in a reddish soil on the banks of a creek, and yields the value of two and three cents to the handful. As large an amount as \$11,000 in handsome gold is reported to have been carried back to Fort Independence.

Col. David E. Buel, accompanied by Professor B. C. Vineut, of London, arrived in the city at four o'clock this morning, in 24 days from Southampton. The Col. has returned for the purpose of having important mining property in the Silver Bend district examined and reported upon, when he will hasten back to London. He speaks highly of the tone of English capitalists concerning the mines of this State.

Silver Bend Reporter, Feb. 29th: Hot Creek correspondence: The Old Dominion mill which was burned down, is soon to be rebuilt. The work still goes on upon the mines, and there is plenty of good rock upon the dumps.

Letter from East Belmont: The "Big mill"—the Queen of the Southwest,—is hammering, roasting and grinding out the silver bricks at a lively pace. Farrel escorted me through the engine room the

other day. Everything in the room is as neat as a pin. They have two of the finest engines I ever saw. The furnace room contains ten reverberatory furnaces.

Paxton & Co. during the week, shipped 13,234 ounces of bullion, the product of the Combination Co's mine at East Belmont.

WASHINGTON.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Territorial Enterprise, March 6th: At the California Bank can be seen to-day two fine bars of silver bullion from the Lady Bryan mine. The largest of these bars weighs 1,288.30 ounces and is worth \$2,105.06; silver, \$1,625.70; gold, \$479.36; gold, .018 fine; silver, .976 fine. The second bar weighs 1,249.30 ounces, and is worth \$2,028.43; silver, \$1,576.49; gold, \$451.94; gold, .017.5 fine; silver, .976 fine. Weight of both bars, 2,537.61 ounces; total value, \$4,133.49.

The Kentuck Mining Company has declared a dividend of \$5 per share, payable on the 14th inst., and the Savage Mining Company a dividend of \$5 per share, payable on the 15th.

NEW MEXICO.

Denver News, Feb. 19th: We received a call a few days since from J. F. Robinson, of the Colorado Mining Co., Morino mines, New Mexico. He has given us an account of the opening up of those mines. * *

The Colorado Co., had, at first, two men working, who took out about four ounces per day. After they got the water in, they began to realize about one hundred dollars. In the first week in September, there was one day in which they took out eight hundred and four dollars worth of gold, with four men at work. On the eighteenth of September, having but three men throwing in dirt, they panned out \$394. At that time the water began to fail them. * * Private parties with reekers and sluices were able to realize from three to five dollars per day. In Humboldt district, Newkirk & Co. have run a tunnel on the upper end of the Scott & Robinson claim, and have struck the bed rock. They found one dollar to the pan. They are still working it. All the miners are waiting anxiously for the spring to open, that active operations may be commenced. There are new arrivals every day.

OREGON.

Jacksonville Sentinel, Feb. 29th: Mr. Alex. Watts informs us that Mr. S. Messinger and himself have just completed a prospecting anastha on Horsehead Gulch, a tributary of Williams Creek, in Josephine County. They are intending to crush several tons of rock from the old Horsehead ledge.

The late rains have given the miners a fair start; all the large ditches are full and the boys are busy making the most of the probably short season before them.

WYOMING.

Cheyenne Argus, Feb. 20th: A gentleman who has just returned from up the road, informs us that a great excitement is raging on account of the discovery of rich gulch diggings at the head of Roek Creek, on the Salt Lake road. Many people were flocking there, and nearly three hundred men had left the working parties on the railroad and joined in the "rush" to the new Dorado. We are unable to learn any particulars as to the extent or richness of the new mines.

RUSTING OF IRON.—Fayen determined that a saturated solution of potassd lye, when diluted with from one thousand to two thousand parts of water, will protect iron from rusting in water. Saturated lime water, when diluted three times, will do the same, but not if diluted four times. Saturated carbonate of soda, diluted with from fifty to fifty-four times its bulk of water, will also protect iron, but not when diluted with fifty-nine times. Fine cast steel requires less potash for its protection.

THE WOODEN WALL-HANGINGS.—The new wood hangings, invented in Boston, of which we spoke a week or two ago, are, it is said, attracting great attention. More than five thousand packages of samples, in envelopes, of the various woods have been given away, and not half who applied could procure them, for want of time to put them up. More than five thousand rolls of the hangings have already been ordered.

RAILROAD TO DENVER.—The Omaha Pacific Railroad Company have notified the Government that they intend to construct a railroad from Denver to the main road, a distance of 102 miles, and have it completed in October next.

A DECAPITATED CHICKEN.—We find the following in the *Bulletin* of March 13th:

A fortnight ago the cook at Sturgis' Hotel, Martinez, Contra Costa County, cut the heads off two young roosters and threw them into a shed to bleed. The next morning he sought for them, but only one remained; the other was found running in the yard alive, and blindly butting the stump of its neck against the fence, unable to guide itself. A guest in the house undertook to rear the maimed bird, and has succeeded in doing so. The wound, though unsightly, has healed, and the creature is apparently as healthy and its plumage as bright as when in its normal condition. Its keeper administers food, water, and gravel by the aperture in its neck, and seems to take in sustenance as readily as when it had bill and tongue. The creature has now subsisted fourteen days, and the wound being healed, there is no reason why it should not live for years.

As a natural curiosity showing that the head is not necessarily a vital member of a vertebrate animal, it has few parallels. Who can say now, with this case before them, of life, motion, digestion and sense of touch remaining in full force after the loss of the entire head and part of the neck, that the victims of the guillotine may not retain some sensibility after decapitation?

The case as here stated, would be an impossible one. Were it true that "the entire head and part of the neck" had been removed, the bird would be incapable of respiration and deglutition. But if, as the *Solano Press* has it, "a small part of the skull was remaining,"—it ceases to be incredible; for that small portion must have included the *medulla oblongata*, or cranial prolongation of the spinal cord, whence are given off the nerves relating to the functions above named. The *cerebellum*, or "little brain," also, was probably uninjured; for to that portion of the contents of the skull, is due the power of regulating or combining the muscular movements. A partial removal of it would have made the motions of the creature in walking, or "running," irregular; while its total removal would have destroyed the power of running altogether.

SEWING MACHINES SIXTY YEARS AGO.—A late number of *Notes and Queries* contains the following, said by a correspondent to be quoted from the *Athenaeum* for February, 1807:

"FRENCH INVENTION FOR MAKING CLOTHS BY A MACHINE.—M. J. Stone, Rue de la Pépinière, Paris, obtained a *brevet d'invention*, or patent, in February, 1805, for 'a machine for joining the sides of segments of all flexible matters,' which he asserts will be particularly serviceable in preparing clothing for the army or navy. It is supposed that one man may do as much work with this machine as one hundred persons with the needle. If it is used to any extent it will more properly deserve the name of 'The Devil among the Taylors,' than the game that is at present so called."

"We find that the machine is fully described and illustrated in the volume for 1824 of the official French '*Descriptions des Machines et Procédes spécifiques dans les Brevets d'Inventions*, etc.' (vol. viii., p. 66, plate 11). It is patented under the names of Messieurs Stone and Henderson. We cannot find that this patent was taken out in England. The inventors were probably Americans from the United States. Its broad principle may be described as being that of passing, to and fro, a common threaded needle horizontally through two pieces of stuff with their edges protruding over a pair of clamps."

THE LAW PROTECTS INVENTORS.—During the war a Colonel Green invented the device of making wells by driving down tubes, and sent a lieutenant to carry out the plan. The latter procured the assistance of a well digger. Subsequently both these parties got ahead of Colonel Green and obtained patents, but after a thorough trial in the courts, the real inventor has defeated his opponents.

CASHMERE GOATS.—One of the last Panama steamers brought thirteen pairs of pure blood Cashmires. They are imported by E. Holland & Co., and are in excellent condition. They are from Georgia.

Those wonderful Brazilian Pebble Spectacles of Muller's, at 205 Montgomery street, are made on truly scientific principles.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers All Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, PROF. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Reed.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. C. Felton.*

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. H. Hill.*

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—*F. W. Hatch.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the application of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Bennett.*

I am happy to express my conviction of the value of the whole treatise. It will give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—*Charles L. Atwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, Jr., M.*

I believe the work will be a valuable and much needed addition to our school text-books.—*Herman Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*L. H. Bryant.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as practical pleaders and advocates at the forum.—*John Curry.*

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. Exactly calculated to interest.—*It will soon become a necessity in every lawyer's library.*—*Charles A. Tuttle.*

Its clearness and comprehensiveness make it easy.—*G. W. Bowie.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end, seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—*S. F. Bulletin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It is most useful, and meets it in a form and size cheap and convenient, and in reach of the humblest.—*Alta California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. F. Times.*

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken), holds it up before you; tears it to pieces before your eyes—or rather, we should say, noisily and skillfully dissects it—displays one by one its several parts, makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such exercises, increasing in complexity as gradually that you do not notice the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—*S. F. Examiner.*

This is unique in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stockton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Marysville Appeal.*

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

San Francisco:

Saturday Morning, March 21, 1868.

Notices to Correspondents.

ONE THAT IS CURIOUS, Placer County,—wants to know whether the organisms termed diatoms, are to be found in other regions, in the same abundance as in California. We may reply that they probably are, but not of the same degree of purity,—a most important consideration when it is desired to employ them as a polishing powder. In the gault of the English southern counties, (a rock belonging to the cretaceous series) with the upper member of which, the rock to be noticed insensibly mingles, lies a soft, white-brown rock, possessing the appearance of limestone. It is remarkable for its low specific gravity, and still more so for the very small amount of lime which it contains. The great singularity of the latter circumstance, consists in the fact that it is overlaid by the great body of chalk, the character of which is so well known as not to need describing. It is vulgarly called marl, in the districts where it is found, and under the impression that such is its character, it has been, and still is employed as a manure. This rock contains nearly eighty per cent. of silica, the balance consisting chiefly of alumina, and oxide of iron; and it is quite probable that diatoms, or some similar organism, forms the bulk of the rock. M. de Sauvage, a French chemist, discovered the same substance in the Department of Ardennes, in precisely the same geological position. The thickness of this stratum varies from ten to sixty feet.

MAN—FRIDAY.—It is quite possible that the idea of Friday being an unlucky day, has its source for the same reason from which it is sometimes known in the United States as "Hangman's Day," and both have probably had for their origin the following cause: At an early period of British jurisprudence, it became an established rule, that any one after being found guilty of willful murder, shall not witness "a second setting sun." In order to modify the rule as much as possible, it became a practice to try persons prosecuted for murder, on a Friday, so that if convicted, Sunday as a "dies non" would intervene, and so give the convicted murderer an additional day to live, and as it was also trusted, would at the same time afford him additional opportunity to make peace with his Maker. It would not therefore be before Monday, which would be the true hangman's day, that such malefactors would be called to expiate their crimes on the scaffold.

A FARMER, Santa Clara.—The extraordinary instance of rapid growth which you name, is by no means extraordinary. The growth of some plants is exceedingly rapid; the leaves sometimes acquiring in a single hour not less than an addition of six or seven times their original weight. D. Desglariere calculated that a turnip-seed does not weigh more than the 14,000 or 15,000th part of an ounce, and that it may increase fifteen times its own weight in a minute. This root has been found to increase 15,990 times its original weight in the course of twenty-four hours.

A CORNISHMAN calls attention to the fact that Professor Rowlandson, in his second article on English Mining Educational Institutions, omitted to make honorable mention of the late Lady Basset, who munificently contributed in the establishment of several mining schools, as well as towards the local museums named, and the School of Mines.

What a Mechanic Should Strive for.

One of the most useful orders of mechanical genius is that which enables the possessor to originate appliances and tools with which to accomplish the odd, and very often peculiar kinds of work, which are frequently presented at the jobbing machine shop. It is not sufficient for one who would aspire to become a thorough mechanic, that he should be merely able to advantageously use all the tools which are furnished him, and when an irregular or odd job is presented, to turn it off by hand or with such tools as may be in present use, and but poorly fitted for the work. He who rests himself upon such a position, is generally one who thinks his duty to his employer or to his trade is merely to labor his regular hours and receive his stipulated wages when pay-day comes. He never troubles his brain to invent machinery to facilitate his manual operations; he leaves all that for his boss or his employer.

The mechanic who acts altogether upon this policy, will never make his mark, and will seldom rise above the drudgery of day labor. Perhaps there may be some excuse for such a course in many cases, where the employer takes but little care or interest in his employes, besides seeing that they make good time, and do the work placed before them in workman-like manner. True, an employer is not entitled in the fullest extent, to the brain-work of his employe. A workman who possesses origination genius, should derive a special benefit from his mental efforts. There should be a degree of equity considered, commensurate to the extra benefit rendered. As a general thing, the workman is not apt to be too exorbitant in his demands, especially when he is properly met by his employer. An encouraging or friendly word is often worth far more than pecuniary compensation, and not unfrequently exerts a most important influence upon the course of the employe.

It is only the patient, industrious and persevering mechanic that makes his mark in the world. He who spends his leisure in frivolous amusements will never leave footprints behind him, which will do honor to himself or benefit or encourage his successors.

It is the crowning glory of the working classes of this country that fully 99 out of every 100 of the patents allowed at Washington are issued to working men—those engaged in the manufacture or operation of workshop machinery. Nearly all our successful inventors are those, who, from their earliest apprenticeship, have been in the habit of devoting their leisure hours to the study of their work, and of the various manipulations in which they have been from time to time engaged. The practical details of the machinery employed in a workshop, should be made a study by every apprentice and other workman in that shop. Such an exercise constitutes the best training for the development of inventive genius; the more so, because complicated mechanisms are frequently brought forward, which in the hands of practical, observing mechanics, may be greatly simplified, and rendered far more available than when originally introduced.

The important truth should be impressed upon the mind of every mechanic, that it is not enough that a machine should have the capacity of doing a certain work, but that it should be so constructed as to do that work in the simplest and cheapest manner. Many a mechanic, working in the humblest capacity, has done himself and the world inestimable service by simplifying and improving tools which have been placed in his hands for service.

It is said that in Nottingham, Eng., a mesh which formerly required sixty motions, is now made with six,—a result brought about by the genius of a common working mechanic. Some twelve years ago, in Mr. Ledger's extensive iron establishment, in

England, a large, and, as was supposed, improved, machine was constructed, under the immediate supervision of the proprietors, for boring locomotive cylinders. It was found, however, to be utterly useless, and was about to be broken up for old iron, when a workman in the shop took it in hand and so improved and simplified it as to render it a most valuable piece of workshop machinery. Most of our readers are familiar with the history of the improvement to the steam engine, by which it was first made automatic in action. Similar instances might be enumerated almost without limit; but quite sufficient reference has been made to encourage the young mechanic, among our readers, to be diligent, persevering and attentive in their calling, to the end that they may accomplish something in their lives beyond the mere performance of ever succeeding daily tasks, which hundreds have done before them. We would say to them;—strive to acquire new ideas; be ambitious to leave foot-prints behind you,—

"Footprints, that perhaps another,
 Sailing o'er life's solemn main,
 A forlorn and shipwrecked brother,
 Seeing, shall take heart again."

Patient, persevering industry, and a mind ever active and alert for improvement, will most assuredly enable you to do so; but without such effort, you can never attain distinction in your calling, or enroll your name upon even the lowest panel in the temple of fame.

Reduction of Antimonial, Argentiferous and Auriferous Ores.

EDITORS MINING AND SCIENTIFIC PRESS: Excuse a mountain pioneer, who has here in the wild mountains, unfortunately, no sufficient resources to answer the following questions, and please inform and enlighten him through the MINING PRESS:

1. What is the ratio of zinc added to lead in order to desilver it by Parke's process?
2. If auriferous lead is treated with zinc, how much of the gold is retained in the lead? Has anybody made experiments in this respect, and who?
3. Can an alloy of lead, antimony and gold, (our galenas always contain a considerable percentage of Sb S³) be treated by the Parke's process?
4. Do any of the recent writers give an exhaustive answer to my questions? Who is it, and where can I find it?

By these questions you can easily see what I am aiming at. As the chlorination process is, under the present circumstances, impossible in Montana, and the pan process scarcely gives satisfactory results, I see no other means than smelting our rich, concentrated pyrites with galena, which is plentiful in a large number of our gold veins, and almost everywhere to be found, and nearly always rich enough in silver to benefit it by smelting and cupellation. (The poorest specimen under my observation contained thirty ounces per 2,000 lbs. of undressed ore).

But where the amount of concentrated iron pyrites in a limited time is not large, a cupelling furnace would scarcely be necessary as the quantity of lead would be small; and if the Parke's process would give good results, the latter would be preferred.

If you would be kind enough to answer my questions, I would show my gratitude by giving you such information about Montana as I should find interesting for the California mining public. As yet, little has been done here, and scarcely anything new could be recorded of our mining matters. Respectfully Yours,

EMIL HENKE.

Ram's Horn Gulch, Madison County, Montana Territory, Feb. 15th, 1868.

REPLY.

First.—The practice pursued on a large scale in Parke's process is to melt six or seven tons of argentiferous lead in a cast iron pot, adjoining which is placed a smaller one for fusing the zinc to be afterwards employed. When the zinc has melted, it is added to the lead in the proportion of from one and a half to two pounds for each oz. of silver contained in the lead to be operated upon. The alloy is then well stirred for from one to two hours. The fire is subsequently withdrawn, and the metal allowed to rest until a scum forms on the top, which, when it has reached a certain thickness, is

removed in the same manner as the crystals of lead in Pattinson's process. The remaining lead is then ladled by means of a gutter into a reverberatory furnace, where it undergoes a process akin to that of softening hard lead, when so caused by the joint or separate presence of copper or antimony; in the case in question, however, zinc with some silver, is the scum which it is anticipated will form on the surface, mixed with some lead. The latter is removed by a method something similar to liquation, an inclined pot in place of a furnace being used for this purpose. The lead so obtained is rich in silver. The residue containing the zinc is distilled in the ordinary manner, by which half the weight of zinc originally employed is obtained. The residue remaining in the distillation pots is always found rich in silver, and ought to be saved until a quantity is collected.

Second.—We cannot give you any positive information on this point; but we have a confused recollection that within the past few months we have seen it somewhere stated that the Parke's process has been employed with complete success in Mexico, with galena or fugo ores, containing gold as well as silver.

For reasons adduced in replying to query three, we consider the presence of antimony rather to promote the surface concentration of the noble metals present. It is probable that a larger proportion of zinc would be serviceable in Parke's process where gold is present, than where silver only is sought.

Third.—Without being able to afford you information of a direct, practical character, we may state that there does not *a priori* appear any reasonable ground for believing that Parke's mode would prove unavailing in the case of gold. Silver and gold, either alone or combined, unite readily with zinc or antimony, and we suspect that antimony would rather promote, when present, the light scum which is formed on the surface of the metal treated by this method, in which scum will be found concentrated the precious metals. We suspect that antimony being present would facilitate this part of the process, but it is equally, perhaps even more probable, that in the subsequent operation of separating the gold and silver from the base metals, the antimony may cause very considerable inconvenience.

Fourth.—No exhaustive treatise has so far been published on the subject which you propound.

We will forward you an extra, as requested, and a letter by mail containing an article from a former number, which may be of service to you.

A GREAT WORK PROJECTED.—It is reported that a company is now being organized in this city, the object of which is the building of a suspension bridge across the entrance to our harbor,—from Lime Point to a place near Fort Point. The plan has been reported feasible by competent engineers. The distance is about one mile. An immense pier, 200 feet wide, and rising to the height of 175 feet above the surface of the water, will be placed in the center. The largest ships can pass on either side. A double railway will belaid upon the bridge, and a light house will occupy the central pier. At each end, the company proposes to erect a revolving monitor tower for the use of the United States. The scheme is a magnificent one, and we hope to "see it" completed.

INTERESTING AND VALUABLE INFORMATION.

The following "essay" was, it is said, handed in to the examiners by an Oxford candidate, a few years since: "Coal is a black mineral. The way they produce it is this: First they dig a large pit in the earth. Then they cut down a quantity of timber and put it in the pit, and cover the whole with peat. Then they burn the timber. After it has been burnt once it becomes charcoal, and out of the charcoal they make oxygen gas, with which we light our streets and houses."

Editorial Correspondence.

(Continued from Page 162.)

THE AMERICAN WHIP COMPANY.

More horse-whips are manufactured in Westfield, Mass., than in all other parts of the United States combined. Its peddlers of "whips and cigars" are known the Union over. It is probably the only town in the world where the business has ever centered. (We be unto it when the spirits of the dumb beasts, from Baalam's ass down to coming generations, shall rise against it.) In European countries every burgh is supposed to have its local whip-makers. Until within a few years past, but little machinery was employed in this manufacture. Now a large portion of the work that was slow and difficult by hand, is rapidly wrought out by machines.

The largest establishment in the trade is the American Whip Co., who have a three story brick building in Westfield, 45x120 feet, accommodating 125 girls and workmen. Besides this, a large number are employed who braid, button, work names, etc., at their homes about the village. In addition to this, the company has a large manufacturing branch in the State Prison at Charlestown, and large wholesale stores in New York and Cincinnati.

The company was incorporated in 1854. Present officers, Henry J. Bush, President; Reuben Noble, treasurer. Capital stock, \$100,000, mostly held by a few individuals. Its assets amount to some \$180,000. The raw material and finished work on hand frequently amounts to \$75,000 or \$100,000. Liverus Hull (present Mayor of Charlestown) is manager of the works in the prison. About 100 prisoners are employed. Many are ingenious. As a whole they appear like a strong band of workers. Destructiveness—a qualification for driving work—prevails as a phenological development; yet one naturally wonders why so many genial, intelligent faces are among them.

The whip most in use is made by taking a square piece of whalebone, tapering gradually to the tip. This is surrounded by split pieces of rattan, tapering from butt to tip, glued on and held together by twine till solid. The stock is loaded with a lead plummet. It is then planed true, covered with strong paper, and sometimes with buckskin or water-proof material; then plaited with linen or cotton thread, and mounted with buttons or ferrules, and varnished. To facilitate this process several attractive machines have been devised by Mr. Hull, whose inventive genius accords fully with his large ideality, continuity, constructiveness, and active temperament. One machine cuts a section of rattan, four or five feet in length, obliquely, as true and as easily as a knife would split it straight. Another planes the whip to its true form. To accomplish this two rasp-like surfaced planers, about 7-inch face and 3-inch diameter, are set perpendicularly side by side, operating independently of each. One revolves to the right, the other to the left; while one moves up the other works down. This peculiar motion obviates the necessity of a strong tension for revolving the whip as it passes between the planers.

The plaiting machines are ingeniously contrived with rotating bobbins, which work rapidly with little power, regulate themselves to the varying size of the whip, and stop instantly on the breaking of a thread, or other derangement. But the most novel of all is the plaiter, which covers the large part of the stock, and forms at the same time a serpentine corrugation, or stitch around the handle. In this the bobbins are horizontal, and rotate on the inner circle of the machine. A circle of 3-inch gear wheels encompasses the frame. Two bobbins are attached on the inside of each gear, one above and one below the center. At every half revolution this gear wheel and its attachment opens clearly through its center, admits the passage of the threads

which forms the serpentine stitch, and closes into a perfect gear; at the same time it imparts a half revolution to the two bobbins, forming the necessary twist in the stitch. This automatic opening and closing of a perfect operative gear, with the drawing through of the thread at the opportune moment, appears like a perfect embodiment of life. We believe it constitutes an entire new mechanical movement. Mr. Hull has other patented improvements which have been a source of advancement in this trade, which we have not time to mention.

IMMENSE IRON PLANING MACHINE.

The machine shops of the Charlestown (U. S.) Navy Yard are a model of good order and fine mechanism. Mr. Seth Wilmarth, master mechanic, has had large experience in his calling, and makes good use of the same, in connection with native ability and energy. His works here, in comparison with operations in other establishments conducted by strictly military men, show the foolishness of our Government in putting army officers in charge of mechanical shops. If the Government, like individuals, would gain wisdom by experience, it would long since have avoided many expensive blunders.

Mr. Wilmarth is now completing a planing machine, claimed to be considerably the largest in the world. It is calculated to take a chip half an inch thick, four inches in breadth, and plane a piece eighteen feet square by thirty-eight feet long on five surfaces without moving,—the top, two sides and two ends; height of frame 32 feet; cross-bar 28 feet long by 4 feet wide, 3 feet 6 inches deep, weighing 28 tons; platen 15 by 17 feet, 3 feet deep; screw 9 inches diameter, 42 feet long, for moving platen; main gear wheels 6 feet diameter, 10-inch face, 3-inch pitch. The cross-head, with tool-holder and fixtures, weighs 40 tons, and can be readily raised by a man with the strength of one arm. A single casting weighs 48 tons. Total weight of the machine, 260 tons. A 6-inch crew carries the tool along the cross-head. The latter moves vertically for cutting slots, etc. Every mechanic knows the difficulty of moving and readjusting large pieces for planing different sides, and besides the delay and expanse, the next to impossibility of getting a perfect angle,—hence the economy of this tool.

STEAM HAMMERS.

We should judge there were over twenty direct-acting steam-hammers in operation throughout the forge shops, with cylinders apparently from 5 to 30 inches in diameter. A hammer, with a 12-inch face, was raised and lowered by the engineer, fast or slow, apparently under as easy control as his own arm. It will forge a steamer-shaft or a horse-shoe nail.

The Charlestown Navy Yard is by far the most extensive in the United States, and we regret the lack of time for further mention of it.

THE FLORENCE SEWING MACHINE WORKS.

This is the leading manufactory in the village of Florence, a place of recent growth, about three miles from Northampton, Mass. Its buildings occupy some two acres of ground. The entire manufacture of these celebrated machines is carried on here. In brisk times, from 250 to 300 men are employed, turning out from 1,000 to 1,200 perfect machines per month. The company provides all the materials and permanent tools used, but a large proportion of the labor is contracted for, by departments, and paid for by the piece, upon its being inspected and accepted by the company's superintendents and experts. By this method many hands and brains are working for self-interest in perfecting machinery and new devices for improving and expediting the work. Such a system of labor-saving machinery (which adds to the perfect uniformity of all the fine and small parts,) is rarely to be found. The best of material is used in

the construction of the working parts of every machine, and no piece is accepted, unless upon close examination it stands a perfect test.

The company's outlay, in order to manufacture perfect machinery economically, has certainly been immense; but their success seems to have more than justified the liberal outlay.

The "Vincent Binder," a Californian invention, is made here, special machinery having lately been prepared for their manufacture on an extensive scale. It is attached to the Florence machine, and is said to be in good favor. Mr. Vincent is an old resident of Stockton. The Florence machine is decidedly novel and ingenious in construction; in which character it is protected by twelve patents.

We had the pleasure of meeting several officers and shareholders of the company, gentlemen of straight-forward business qualifications,—like their excellent San Francisco agent, Mr. Samuel Hill, a native and former highly esteemed citizen of Northampton.

SILK THREAD MANUFACTURE.

There are several manufactories of this article in Florence, Mass. We visited that of the Nonetuck Silk Company, with the assistant superintendent, Mr. A. G. Hill, a relative of Samuel Hill, agent for the Florence Sewing Machine in San Francisco. The raw silk is taken as imported from China, and brought out into even threads of various degrees of fineness. It is then colored to any shade required for the market. Notwithstanding silk is an article which takes colors remarkably well, choice coloring is an important item in competing for trade. Owing to the wax and unevenness in the raw material, there is about 25 per cent. loss in weight in manufacturing. The stock is imported at from \$7 to \$10 per pound,—a reduction of \$5 or \$6 from prices during the war.

PO-PO-AGIE.—This is the name of a valley described by the *Sweetwater Mines*, situated thirty miles northeast of the Shoshone district, in the mines from which that journal derives its name. Its length is fifteen miles, with an average breadth of about five miles. Eight miles above its junction with the South Fork of Wind river, the Po-po-agio river forks, having a valley between the forks that for beauty is seldom equaled. The soil is a black loam, capable under cultivation, of producing the very finest crops of cereals, and well adapted to fruits of certain kinds, for we found last summer strawberries, raspberries, black, white, and red currants, wild cherries, etc., in greater abundance than we have seen anywhere else in this western country. This valley produces the finest quality of native grass we have ever seen; if we should say how high we have seen it grow, no person other than those who have been into the valley would credit our story. The hillsides are covered with a great abundance of bunch grass, and the mountain sides with a heavy growth of pine and fir timber. This valley, like all the adjacent ones, is a perfect paradise for game. Herds of buffalo, elk, antelope and black-tailed deer can be met with in a day's hunt, with an occasional grizzly and cinnamon bear thrown in.

Little Po-po-agie valley and river is situated ten miles nearer the mines, and although not so extensive, contains several thousand acres of excellent tillable land and possesses the same characteristics as Big Po-po-agie valley. Large cottonwood trees abound on the banks of both streams. The rivers are said to be full of fine fish. Large deposits of coal have been discovered in Po-po-agie valley—a circumstance of no slight importance to a quartz mining community, when fuel constitutes one of the principal items in the bill of expense in the reduction of the ore.

DIFFERENCE IN WATER FOR MANUFACTURES AN IMPORTANT MATTER.—The *Economist* says that manufacturers often overlook the importance of taking note of the character of the water which they use. Cloths, ales, dyes, etc., are especially dependent on the water employed, and when it is in contemplation to build works upon a certain stream, a chemical analysis of its water should be first made, in order that it may be compared with that of those localities where the same manufactures has been a success. We quote:—"We have heard of a leather manufacturer in the north of England, whose leather was so acceptable that ultimately his entire product was taken by the London market. Thinking that by removing about 300 miles nearer the metropolis he could save the heavy expense of transportation, the manufacturer established his works within a few miles of London, taking with him his principal workmen, and preparing his leather in precisely the same manner as in the north. Within twelve months his leather lost its reputation, and when it was too late he found that he had overlooked the virtues of the northern water."

The American Spring Bed.

THIS BED, NOW SO POPULAR IN THE EASTERN and Western States, was patented August, 1893. For practical utility, comfort and durability, it is unsurpassed. It is easily applied to any bedstead. It is portable, and not liable to get out of order. The price is about one-fourth that of the spring mattress. It combines elegance with cheapness and comfort. Call and see it. Mechanics' Institute Building, No. 29 Post street, San Francisco. 8v16-3m

To Mine Owners.

THE SUBSCRIBER, HAVING HAD MANY YEARS EXPERIENCE in Mining and doing business connected with Mining Operations, offers his services to parties wishing to purchase mines, to examine and report upon them, to buy, report upon the titles of any mine offered for sale, and to transact any business connected with mining operations in this District. Also, he would take the Superintendency of the affairs of a Mining Company. Refer to proprietors of Mining and Scientific Press. Address: JAMES DELAVAN, Lone Pine, Inyo Co., Cal. 4v16f

CARD.

THE UNDESIGNED, SINCE DISPOSING OF HIS Gallery on Montgomery street, has seldom been in the street without being asked where the best photographs were taken. Now, for the benefit of his friends and the public generally, he would recommend them to go to the COSMOPOLITAN ART AND PHOTOGRAPHIC GALLERY, No. 24 Kearny street, now owned and occupied by Messrs. H

WASTE OF MINING PRODUCTS.—The following is from a communication by W. L. Rickard, F. C. S., to the *London Mining Journal*: "I am surprised at the indifference with which the loss of so much wealth is regarded, when its recovery may be effected by the employment of a moderate amount of capital, under the direction of some of the skill and talent so abundant in England at the present moment."

One of the most glaring instances of this wanton waste is that which has been going on during the last eight years, and still continues at the Comstock lode, in Nevada, where from one-third to a half of the precious metals (say one and a half million sterling) is lost in the form of slimes and tailings, which, by a proper system of working, can be recovered without any of the ordinary mining risks, a few furnaces, buddles, and amalgamating machines being all the apparatus required, after an economical system has been organized for their collection.

Some of the most far seeing amongst the mill owners have commenced saving this valuable refuse, and at the present time many hundred thousands of tons are collected, and may be purchased for a nominal price; but as the rich slimes (worth from 8¢. to 12¢. per ton), the most profitable proceeding would be to collect the slimes as fast as produced, and subject them to special treatment, while the tailings could be concentrated by means of buddles, or any apparatus for this purpose; the gold and silver in them being associated with the sulphides of iron, copper and lead, while in the slimes the silver exists chiefly as chloride and the gold free.

It may appear incomprehensible that an energetic and long-headed people like our American cousins, should permit this extraordinary waste to go on, but the fact is they are so bent on working large quantities of ore in the shortest possible time, to keep pace with the enormous yield of the mines, that so long as a margin of profit is shown by the present system they will not expend addition capital to recover their waste.

CONSUMPTION OF SMOKE.—G. Alston thus describes his improvement in this direction: I admit air on the top of the fuel, above the fire-bars, from the front of the furnace; the draft being regulated by a suitable damper or sliding door at which the fuel is introduced. The ash-pit is kept closed at all times, except when removing the cinders, the damper being closed at such time; the back of the furnace chamber is also closed by a plate or partition. In this manner the fresh air is forced to pass down through the fuel and fire-bars, drawing with it the smoke and flame, and so effecting its almost entire combustion, the smoke afterwards passing away through the flues as usual. The fire-bars I make of fire-clay, in order to withstand the great heat produced by the down draught.—*Colliery Guardian*.

PAPER BOAT.—The *Tribune* says: Walter Brown, of Portland, has brought home a new paper boat of the Waters' patent, from a model of his own. This boat is 31½ feet long, 12 inches wide, and weighs but 22 pounds. The lightest wooden boat ever previously built of similar dimensions, weighed 41 pounds. The most singular part of the matter is that the paper boat is more than four times stronger than one of wood. All of it, save where the sculler sits, is gas-tight, so that in the event of a race, sufficient gas may be taken into it to reduce its weight to eight pounds.

PAPER.—There are in the United States 530 paper mills. The annual production of paper in Europe is 8,956,000 cwt., valued at £15,005,000. The improved paper mills working continuously for a whole year would manufacture 62,560,000 sheets, which if laid side by side would extend to a length equal to that of the diameter of the earth.

THE PEDESTRIAN.—Payno, the man who has undertaken the feat of walking from New York to San Francisco, in 150 days, has got as far as St. Joe, Missouri. On the route he delivers lectures at the important points, and besides this is taking copious notes for a book.

BLEACHING PETROLEUM.—Petroleum is bleached by shaking it repeatedly with oil of vitriol, and then with a strong solution of caustic soda, allowing the oil to separate each time. A subsequent distillation will greatly improve it.

COAL IN COLORADO.—Mr. Sartell is developing a vein of coal about three feet thick, on Deer creek, fifteen miles above Denver. The vein is opened about one mile from the Platte river, and the coal is said to be of excellent quality.—*Denver News*, Feb. 26.

Rates of Postage on Printed Matter to Europe and Asia.

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:

NEWSPAPERS—MAILED AS FOLLOWS:
Bremen, by Bremen mail—2 cents each.
Hamburg, by Hamburg mail—2 cents each.
Prussia, Austria and German States, by Bremen and Hamburg mails—3 cents each.
Lunenbourg, by Bremen mail—3 cents each.
Lunenbourg, by Hamburg mail—3 cents each and 1 cent per 1½ ounce.
Schleswig-Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1½ ounce.
Sweden, by Bremen or Hamburg—3 cents each, and 1½ cent per 1½ ounce.
Norway, by Bremen or Hamburg—3 cents each, and 3½ cents per 1½ ounce.
Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.
Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.
Switzerland, by Bremen or Hamburg—4 cents each.
Italy, by Bremen or Hamburg—5 cents each.
Turkey, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.
Greece, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.
Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 2½ cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1½ ounce.
Austria, India and China, by Bremen and Hamburg mails, via Trieste—3 cents each, and 2 cents per ½ ounce.

PERIODICALS, ETC.
Bremen, by Bremen mail—1 cent per ounce.
Hamburg, by Hamburg mail—1 cent per ounce.
Prussia, Austria and German States, by Bremen or Hamburg—1½ cent per ounce.
Lunenbourg, by Bremen mail—1½ cent per ounce.
Lunenbourg, by Hamburg mail—1½ cent per ounce, and 1½ cent per 1½ ounce.
Schleswig-Holstein and Denmark, by Bremen or Hamburg—1½ cent per ounce and 1½ cent per 1½ ounce.
Sweden, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.
Norway, by Bremen or Hamburg—1½ cent per ounce, and 4 cents per 1½ ounce.
Holland, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.
Russia, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.
Switzerland, by Bremen or Hamburg—1½ cent per ounce, and 1 cent per ½ ounce.
Italy, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per ½ ounce.
Turkey, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.
Greece, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.
Gibraltar, Spain and Portugal, by Bremen or Hamburg—1½ cent per ounce, and 2½ cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mail via Marseilles—1½ cent per ounce, and 9 cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mail, by way of Trieste—1½ cent per ounce, and 2 cents per ½ ounce.
These charges are in each case in full to destination, combining rates between the United States and Bremen or Hamburg, and the rate beyond Bremen and Hamburg to points of delivery.

MOSHEIMER'S

Pioneer Mining School,

ASSAY OFFICE

—AND—

Metallurgical Works,

SAN FRANCISCO.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

- 1.—**Assaying of Ores, Metals, and other Mineral Substances.**
- 2.—**Metallurgy of Gold, Silver, Copper, Lead, etc., by Smelting, Amalgamating, Lixivation, etc.**
- 3.—**Gold Extraction, by Chlorine Gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.**
- 4.—**Concentration.—Dressing of Ores.**
- 5.—**Construction of Furnaces, in which any kind of fuel may be used for Smelting, Roasting, etc., as well as the erection of any Machinery or Apparatus required in Metallurgy and Technology.**
- 6.—**Technology, or Chemistry as applied to any special branch of Manufacturing.**

By my Practical Mode of Teaching, any person of ordinary ability can learn to assay Ores in three lessons, and the working of all the ordinary and refractory ores in a few weeks.

Gentlemen of almost every profession, who, within the last two years have graduated at my establishment, will bear testimony that from my instructions they have learned more in a few weeks than they ever expected to learn.

My charges are from \$50 to \$200.

Ores of every description assayed and worked

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals.

It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exerting a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

San Francisco.

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out.

Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

J. M. BUFFINGTON,

17v15-1f No. 5 Government House, San Francisco

\$100 A MONTH SALARY WILL BE PAID FOR Agents, male or female, in a new, pleasant, permanent business. Full particulars FREE by return mail, of sample retailing at \$4.50 for \$50 cents. A. D. BOWMAN & CO., No. 4 Broad street, New York. (Clip out and return this notice.) 10v16-3m

LAND SLIP AT NAPLES.—A terrible event occurred at Naples on January 28th. Part of the cliff of Pozzofalcone became loosened, and came down with a crash,—burying a number of houses in the ruins. It is feared that seventy or eighty lives were lost; although as the buildings were partly *cafes* and wine-shops, which are more or less filled at that time,—8 o'clock P. M.,—with stragglers and transient customers, the number is not precisely known. A considerable number made their escape through fissures in the walls of buildings which partially resisted the crush. All Naples flocked to the spot, and the excitement was intense. The military were set at work to clear the ruins, and extricate the bodies of the dead and of the living. An omnibus full of passengers, which was passing at the moment, was overwhelmed. Two of the occupants were Americans. The house which Bayard Taylor occupied was buried beneath the wreck of three others which were situated farther up. Fortunately Mr. Taylor and family had left it a few days previous, for a visit to a New York gentleman who had a house in Sorrento.

CHAMPAGNE FROM PETROLEUM.—The Portland (Me.) *Star* says that a sparkling wine is now made from bedzole, which is sold as champagne. Pea nut coffee, and turnip cider, are thrown in the shade by this new swindle.

ESTABLISHED [MAY, 1860.]

VOLUME SIXTEEN

—OF THE—

Mining and Scientific Press,
COMMENCING JANUARY, 1868.

DEWEY & CO., Publishers.

Issued every SATURDAY, at our Book and Job Printing Office, 505 Clay street, corner of Sansone, San Francisco. Terms in Advance.—One year, \$5; Six months, \$3; Single copies, 15 cents; Monthly Series, \$5.00 per year, or 55 cents per number. Back Volumes from January, 1864, \$3 per volume; bound, \$5 per volume.

The Mining and Scientific Press is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal on this coast. The individual character and reputation of its constant patrons throughout the entire coast is one of the best recommendations of its merits and value as a medium of intelligent progress and prosperity.

College of California.

Department of Chemistry,

UNDER

PROF. W. B. RISING.

The Laboratory has recently been fitted up so that each student will be supplied with a set of Chemical Reagents at his own desk.

The Course of Instruction will include a thorough drill in Qualitative Analysis, and advanced students will be furnished every convenience for Quantitative Analysis.

Attention will be given to the detection and separation of poisons.

Also, instruction in the Assay of Gold, Silver, Copper, Lead, Mercury, and other Ores.

Students from abroad, prepared to proceed with the class in the studies of this department, may be admitted on application to the Professor in charge. 5v16tf

Postage.—The postage on the MINING AND SCIENTIFIC Press to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to an address in the United States, two cents.

Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair.

Options of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

BANK OF BRITISH COLUMBIA,
San Francisco, May 24, 1896.
Recently, two of Wm. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor and in every way meet our fullest approval.
They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.
We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find it difficult in either opening or closing it, nor in changing its combinations, which may be made almost innumerable.
As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it.
WM. H. TILLINGHAST, Sub Manager.

We do hereby certify, that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and impossible to be picked. We have applied several to Vaults and Safes, to entire satisfaction to parties interested.
KITTREDGE & LEAVITT,
Pioneer Iron Works, cor. Fremont and Market sts.

SAN FRANCISCO, May 6, 1897.
I do hereby certify, that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safes and Vaults in every other respect as good as any other improved combination lock which I am acquainted with.
JOHN R. STEVENS,
Vault Manufacturer, Oregon street.

JACKSON, April 27, 1897.
I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons:
1st.—Because it is impossible for either burglar or expert to pick it.
2d.—The lock being constructed without a key-bolt, it cannot be blown to pieces with powder.
3d.—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making.
R. CORNER.

Attested by J. C. SHEPMAN, County Clerk.
JACKSON, April 27, 1897.
The undersigned, Treasurer of Amador County, do hereby certify that I am now using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's safe. I have no fear of any by-stander gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe every few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it.
OTTO WALTHER.

CALIFORNIA LOCK ALARM.—A special premium was awarded Mr. W. C. Bussey, for his superior Combination Powder and Burglar-Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the Press several months since. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable claims asserted in favor of the lock at that time, have been confirmed since by its practical use. We feel an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly first fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates.—(Mining and Scientific Press, Sept. 29, 1896.)

They are the only rare lock ever invented. Every State and County treasury vault, and every bank and business place should have one.—(Amador Ledger.)

This is a lock in which a series of rotating annular tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely simple and effective lock is obtained, precluding an almost unlimited number of combinations. For which he was awarded a special premium at the State Fair.—(Sacramento Union.)
We, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar Proof Lock to be the most reliable lock constructed.
K. MARK & C. FLEMING,
No. 18 Post street.

REFERENCES:

R. CORNER, Sheriff.
O. WALTHER, Treasurer.
W. JENNINGS,
O. H. INGALLS, Supervisors.
L. MC LAINE,

Any good blacksmith can put this lock on safe doors. Dressed or single old locks removed and this placed in their stead, to work out, two, three or four bolts, as the case may be.—(See page 30 in Pacific Coast Directory.)

A dealer blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination.

And in accordance with law, and an order of the Board of Trustees, made on the tenth day of February, 1898, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Maurice Dore & Co., at their salesrooms, No. 327 Montgomery street, San Francisco, on Monday, the sixth (6th) day of April, 1898, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. H. PECK, Secretary.
Office, 212 Clay street, San Francisco. mar21

Illegal Supplemental Advertising.—It would be well for Mining Companies, whose advertisements are repeatedly appearing in the Supplements of daily papers, to inquire into the legality of that class of advertising.

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of March, 1898, an assessment of two (\$2) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 318 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twentieth day of April, 1898, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the sixth (6th) day of May, 1898, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN P. LOISE, Secretary.
Office, 318 California street, Up stairs, San Francisco. California. mar21

Succor Gold and Silver Mining Company.—Location of Works: Storey County, State of Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the tenth day of February, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Aldrich, Lewis	143	79 11-24	\$39.40
Aldrich, Lewis	144	41 1/2	22.25
Aldrich, Lewis	145	151 13-24	75.75
Aldrich, Lewis	146	29	10.00
Over, Benjamin	71	5	2.50
Over, Benjamin	72	5	2.50
Over, Benjamin	73	5	2.50

And in accordance with law, and an order of the Board of Trustees, made on the tenth day of February, 1898, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs Olney & Co., No. 418 Montgomery street, San Francisco, on the fourth day of April, 1898, at the hour of 12 o'clock M. of said day to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

E. J. MOORE, Secretary.
Office, Nos. 77 and 78 Montgomery Block, San Francisco, California.

POSTPONEMENT.—The above sale is hereby postponed until Saturday, the eleventh day of April, 1898, at the same hour and place. By order of the Board of Trustees.

E. J. MOORE, Secretary.

mar21

Mining Notices—Continued.

Folsom Street and Fort Point Railroad and Tunnel Company, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors of said Company, held on the tenth day of March, 1898, an assessment of five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to Caleb T. Fay, at the office of the Company, Room No. 16 Stevenson Block, on the southwest corner of Montgomery and California streets, San Francisco, Cal.

Any shares of stock upon which said assessment shall remain unpaid on the eleventh day of April, 1898, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-seventh day of April, 1898, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

JOS. M. WOOD, Secretary.
Office, Room No. 16 southwest corner of Montgomery and California streets. mar14

Fogus Mill and Mining Company.—Location of Works: Amador County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of February, 1898, an assessment of ten dollars per share was levied upon the capital stock of said Company, payable on the twentieth day of February, 1898, in United States gold coin, to the Secretary, at his office.

Any stock upon which said assessment shall remain unpaid on the twentieth day of March, 1898, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the ninth day of April, 1898, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN J. SCOTCHLER, Secretary.

Office, No. 321 Front street, San Francisco. feb22

Great Central Mining Company.—Location of Works: Yuma County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of February, 1898, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on the twenty-third day of March, 1898, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the fourteenth day of April, 1898, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.

Office, No. 302 Montgomery street. feb22

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirteenth day of February, 1898, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Pioneer Hall, (up stairs) Montgomery street, near Jackson, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of March, 1898, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the fifteenth day of April, 1898, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. CROWNSHIELD, Secretary.
Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. feb22

Kearns Mining Company, Kearns District, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth (20th) day of January, 1898, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 408 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of February, 1898, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirteenth day of March, 1898, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.

Office, 408 California street, San Francisco. jan25

POSTPONEMENT.—The day for selling stock delinquent on the above assessment is hereby postponed until Tuesday, the twenty-fourth (24th) day of March, 1898, and the sale thereof until Thursday, the sixteenth day of April, 1898. By order of the Board of Trustees.

T. B. WINGARD, Secretary.

feb29

Lyons Mill and Mining Company, Kelsey District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-second day of February, 1898, an assessment of two dollars (\$2) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the twenty-seventh day of March, 1898, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirteenth day of April, 1898, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.
Office, Room 37 New Merchants' Exchange, California street, San Francisco. feb29

La Blanca Gold and Silver Mining Company, District of Ures, Sonora, Mexico.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the second day of January, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the mullor forces the pulp to the center, where it is drawn down, through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,
San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

NOTICE TO MERCHANTS

MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength; less danger in working; as goods require no shunting or landing, consequently make fewer breakages; requires one man less to operate; it stops with the load at any point, without any fastening or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages the advertiser is enabled to offer these machines to the public at the following low terms:

No. 1.—Or 10 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price to the order, \$9000

No. 2.—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour, \$850

No. 3.—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour, \$1200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient light to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1866.
JAMES BRODIE, Esq., San Francisco.—My Dear Sir: I beg to express my pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
R. P. JOHNSON,
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the improved German Barrel, for a longer term than twelve months. All persons desiring of compromising, without having recourse to legal proceedings, for past infringements, or desirous of receiving Letters of License for the limited period named, are requested to address as below. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations are afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22nd, 1866. JAMES BRODIE, Fulton Foundry, or CHARLES RACINE, Express Building, 402 Montgomery street, San Francisco.

WILCOX'S
Patent Steam Water Lifter.

Received First Premiums at the California State Fairs of 1866-7.

Send for Circular.

A Steam Pump without Engine, Piston, Plunger or Buckets, using both the expansive and exhaust power of steam, and doing more work with the same amount of fuel, than any other Pump driven by steam power. It is applicable to either light or heavy work, whether for mining, irrigation, or other purposes. It has been used of various capacities, from 500 to 40,000 gallons per hour, and can be made of any size required. It is not injured by sandy or muddy water. In height of lift it is limited only by the strength of the boiler used.

For further information, apply to M. & A. WILCOX, Proprietors, 19 Front Street, between I and J Sts., Sacramento, Cal. 25-15-2m3m

BLAKE'S PATENT
QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a rollease of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Up-right Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

BLAKE & TYLER,
Agents for the Pacific Coast.Notice to Miners,
Well-Borers and Water Companies.

M. PRAD is NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

MEANS OF ASCENDING AND DESCENDING

SHAFTS.—In a recent lecture at the Royal School of Mines, Mr. Warrington Smyth spoke of the plans adopted in different countries, for raising and lowering the miners in shafts. We quote from the report of the lecture as given in the London Mining Journal: "The worst ladders were those resting upright against the walls of a shaft. An ascent or descent of fifty, sixty, or eighty fathoms every day upon a perpendicular ladder, was found to affect the heart and lungs very injuriously, besides the risk of instantaneous death by missing hand or foot hold. The proper angle was about seventy-five degrees. Where the shaft was perpendicular, a system of sollars was used, by which the descent was divided. Each sollar had a man-hole, with a trap-door, so that a man would not have a fatal fall in case of accident. In several localities on the Continent very short ladders were used, not being more than two fathoms in length, and each sollar guarded with sides. In other places 4, 5, or 6 fathoms were common. The ordinary run of English mines had twenty to forty fathoms for the prevailing lengths. The longer lengths, however, were all more or less fatiguing, and in the deeper mines the average life of miners was shortened in consequence of this as much as by the bad air they breathed, so that many plans had been proposed to get rid of this labor. This had been tried by raising the men with the same ropes and chains that raised the mineral, but it was found to be too risky. The first step to a good solution of the difficulty was taken in Germany, by employing the pumping machinery, and it was put into practice there just at a time a premium was offered in this country by the Polytechnic Institution of Falmouth, for the discovery of some unobjectionable means of lowering and raising miners. Watching the action of the pumping rod, the two observers, (one in Germany and the other in Cornwall, without any communication with each other) conceived the idea that by making a foot hold on the rod, the miner would be drawn up as much as the length of the stroke at each stroke, when he could step off on to a platform, and then to a rod on the other side, which would just have completed the down stroke, and be ready to ascend. At first it was intended that only a few men should ride in this manner on the pumping rod.

The shaft being all open and unprotected, it required a good deal of nerve to step across the yawning abyss below, but it was found so advantageous, that eventually arrangements were made to carry all the men; and at Mansfeldt, in Prussian Germany, a plan was adopted by which the platforms nearly touched each other, so as to avoid this danger. In Cornwall the ascent and descent were made in a similar manner, but independently of the pumping rods, by what was called by the miners there the "man-engine." Most admirable machinery of this kind had been put up by M. Warneque at his colliery at Mariemont, where the step was large enough to accommodate two persons at once, and so well boxed in that all risk seemed to be removed. He spoke of risk, because there had been one or two sad accidents with the man-engine, arising out of persons going down by it, who not being accustomed to the noises of a pit, lost their coolness and presence of mind, did not keep clear, and came in contact with the beams. In this country a great improvement had been made in this respect, and instead of two rods a single rod was put in, the steps being 2 fms. apart, and at corresponding intervals sollars were constructed, which the steps all but touched. It made about eight strokes in a minute, and 12 ft. at a stroke, so that the rate of ascent or descent was 72 ft. in a minute. The expense of this single-rod system was not considerable, and wherever a shaft was 150 fms. deep, or more, a man-engine should be put in."

GERMAN RAILWAYS.—In some parts of Germany, railways have been constructed without the use of wood. The rail is made about nine inches high, with a broad flat base, which rests on a well prepared bed of ballast, and when properly fixed is further supported by a layer of gravel. Thus constructed, the jerky motion of a train, occasioned by numerous cross-sleepers, is done away with; the hammering sound becomes a steady, continuous roar, the longitudinal bearing is distributed over a greater distance, and the need for repairs occurs but rarely.

BEHIND THE AOE.—Col. J. F. Meline, U. S. A., in his recently published book entitled "Two Thousand Miles on Horseback," has the following:

"I can imagine no objects that would attract more interest and wonder at an American agricultural fair than a New Mexican cart, plow, and yoke—not to mention some smaller things. The plow takes you back at once to Biblical simplicity. In looking at its heavy beam, some sixteen feet long, with a small forked piece of wood attached, you wonder, first, how it could ever be moved, and, secondly, what earthly (the proper word in that connection, I think) good it could ever effect. The cart is made of the brittle cotton-wood, in a manner that shows a general absence of tools in its construction. Neither steel, iron, nor nails are used, and strips and strings of rawhide fasten the pieces together. For the wheels, a clumsy, thick, oblong block of wood is placed by wooden pegs to two segments of a circle; through these a hole is hacked to pass the axle-tree. The circle, of course, never attained; an approximation to it being all that is thought desirable. No grease. Excruciatingly vocal, and murdering sleep within a circumference of a mile. A supply of heavy axles is loaded into the cart for any journey beyond a day, so that it is frequently half filled with them."

SOUTH AMERICAN EXPLORING EXPEDITION. The expedition from Williams College, which left the States early in the summer of the past year for the purpose of making scientific explorations in South America, arrived in New York February 11th, from Para. The party comprised two divisions, one of which, starting from Guayaquil, upon the western coast, crossed the Andes, and passed down the Rio Napo, meeting upon the Amazon the other, which started from Caracas, upon the coast of Venezuela, and proceeded up the Orinoco and down the Rio Negro, making a distance of 2,500 miles by canoe.

All About Sending Money by Mail.

RATES OF COMMISSION.—The following are the rates charged (in currency) for transmitting money to any part of the United States:

On Orders not exceeding \$20.....10 cents.
Over \$20 and not exceeding \$50.....25 cents.
No fractions of cents to be introduced in an order.
United States Treasury Notes, or National Bank Notes only received or paid.
To send over \$50, additional Orders must be obtained.
Post Offices where Money Orders may be obtained will furnish blanks as follows, which the applicants will fill out:
No. Amount Date,, 1886 ..

MONEY ORDER.

Required for the sum of \$.... Payable at
State of Payable to Residing at
Residing at State of Sent by
Entered in Register: State of
Names of parties and places, and the sums, to be written in the plainest possible manner.

As there are several places of the same name in the United States, applicants must be careful to indicate which of them they mean; and the Postmaster will satisfy himself, before writing out the order, that the place indicated is the one intended.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED
FOR
Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES
Fifty Per Cent.
LESS POWER
Than any Blower
now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.
CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For Circulars and further information, address

KEEP, BLAKE & CO.,
Globe Iron Works, Stockton, Cal.

WE ARE NOW OFFERING
OUR IMMENSE STOCK

U. S. NATIONAL BANKING SYSTEM.—We have received from the author, John Williams, editor of the *Iron Age*, a pamphlet entitled,—"Letter to Hon. Robert C. Schenck, M. C., Chairman of Committee of Ways and Means, on the origin, object, and effect of the National Banking System of the United States, with some suggestions for its improvement." Mr. Williams claims to have been the originator of the system, which with some variations is now in force, and declares that its imperfections consist in those variations. He urges that to adapt it to the present condition of the country, it is only necessary to adopt, in its entirety, his original proposal.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS & JESSUP, corner of Montgomery and Sutter streets, over Tucker's Jewelry Store, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with **PURR GOLD**—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14-tf

Miners, Visitors to mining districts, R. R. EMPLOYEES, and TRAVELERS generally, should insure against all Accidents in the Traveler's Life and Accident Insurance Company of Hartford before leaving the city.

ANOTHER CALIFORNIA ENTERPRISE.—A Factory has been started in this city for the manufacture of AUSTIN'S CELEBRATED BRILLIANT PASTE BLACKING. This preparation not only produces a most brilliant polish; but, unlike imported Blacking, it is pronounced the best LEATHER PRESERVATIVE ever introduced. Trades supplied twenty per cent. less than any imported article. Factory, No. 1 Montgomery Court, near the corner of Broadway. 26v15-3m

MEDICAL AUTHORITIES have announced that not less than one-fifth of the entire population of the United States are afflicted with Neuralgia in some form. Surely the man who can safely remove such a vast aggregate of pain is a great public benefactor. Such is Dr. Turner, of Boston, in Massachusetts. His "Universal Neuralgia Pill" is pronounced on all hands, to be an entirely harmless and perfectly certain remedy for this most torturing of all known diseases. See advertisement in another column.

DISEASES OF THE EYE.—During a late visit to San Francisco, we fell in with an old acquaintance from this country, Mr. O. W. Purdy, who formerly resided at Forrest City. About two years ago, while under treatment, we saw Mr. Purdy at the office of an oculist in that city, with eyes badly inflamed and the sight entirely lost. We saw him a few months later at another physician's, but his case was scarcely improved, and seemingly hopeless. His eyes have now entirely recovered, so that he goes about his ordinary business. From his own lips we learned that the restoration of his sight was entirely due to Dr. D. R. Morgan, whose office is at No. 627 Sacramento street, between Montgomery and Kearny, who cured him in the short space of eighteen weeks. Mr. Purdy mentioned several remarkable cures which occurred in the practice of Dr. Morgan during the time he was under treatment, among which was that of Mrs. Jane Albert, of Brownsville, Yuba County, and several others. Mrs. Albert had been afflicted with sore eyes from early childhood, and for eleven months previous to treatment she had not been able to discern light, nor had she seen the features of her youngest child, twelve months old. She had heard of the remarkable cure of Leonard P. Eder, of Marysville, and Joseph E. Haskell, of Sacramento, and determined to try Dr. Morgan. The result was that she was able, after ten days, to read ordinary newspaper print. Mr. Purdy was of course greatly rejoiced at the recovery of his sight, after so many trials and failures with different physicians.

The above is clipped from the *Mountain Messenger*, of February, 1888. 10v16-3m

HENDY'S LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators or pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:
FIRST—In setting up, set the pan, A, level by the inner rim, near its center.
SECOND—While in operation, keep the Pan, A, about half full of sulphurets.
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL. (8 Concentrators).....Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators).....Grass Valley, Nevada County.
NORRIDGEWOCK MILL. (2 Concentrators).....Grass Valley, Nevada County.
VALENTINE & CO., Commercial Mill (3 Concentrators).....Nevada County.
HUMBOLDT CANAL CO. (1 Concentrator).....Humboldt County, Nevada.
ROBINSON & McALLISTER M. & M. CO. (3 Concentrators) Hunter's Valley, Mariposa County.
PLYMOUTH ROCK MILL CO. (2 Concentrators).....Calaveras County.
MIDAS MILL CO. (4 Concentrators).....Virginia, Montana.
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....Virginia City, Nevada.
VULTURE CO. (8 Concentrators).....Prescott, Arizona.
NOYES & CO'S MILL. (2 Concentrators).....Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....Owyhee District, Idaho.
MOREY & SPERRY (1 Concentrator).....New York.
GUADALUPE & SACRAMENTO G. & S. M. CO.....Sinaloa, Mexico.
EL TASTE CO. (2 Concentrators).....Sonora, Mexico.
B. F. BROWN (1 Concentrator).....Melbourne, Australia.
JAMES HENTY & CO. (1 Concentrator).....Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1887.

J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

NORTH STAR MINE, Grass Valley, Feb. 26, 1888.

J. HENDY, Esq.—Dear Sir:—In answer to your request, I give my opinion in regard to the eight Concentrators we have at work. We have had one at work on blanket washings for the past three months, and it has proved highly satisfactory in saving sulphurets and amalgam, that in past years we have been losing. Of the other seven, six are taking the pulp from the batteries, and the remaining one concentrating from the six, which, when thus reconcentrated, yield 95 per cent. of pure sulphurets. Respectfully, etc.

W. H. RODDA, Supt.

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. CO., }
VIRGINIA CITY, Nev., Sept. 17, 1887. }

JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours, very truly,

LOUIS JANIN, Jr.

The bill was presented in accordance with the above request, and duly paid.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

Work at the Hoosac Tunnel.

WESTFIELD, MASS., Feb. 12, 1868.

NOTE.—It is intended to state facts as briefly as possible in this article, mainly from notes and observations made Nov. 19th and 20th, 1867. The object is to afford a more direct railroad thoroughfare, with light grade, from Boston to Troy.

Hoosac Mountain is in the northwest corner of Massachusetts, thirty miles west of Greenfield. The east portal of the tunnel is at the base of the mountain, close by the great bend in Deerfield River. Just below, the cañon emerges into a small but beautiful valley. Surrounding mountains rise from 500 to a 1,000 feet high, with steep ascent. The western portal is two miles from North Adams, present terminus of the Boston and Troy R. R. It fronts a fertile valley, which is overshadowed by "Old Greylock (Saddle Mountain), the highest peak in Massachusetts.

The direction of the tunnel is east and west; length, 25,031 feet, or nearly five miles; dimensions, 24 feet wide by 22 feet high; grade, each way from center, 5-10 of a foot in 100 feet.

The work was undertaken in 1850, by the Troy and Greenfield R. R. Co., hacked by a loan of \$2,000,000 from the State of Massachusetts. In 1862, the railroad company having failed, the State took the work upon itself.

AT THE EAST END,

the improvements comprise a 3-story machine shop, blacksmith shop, office, store, school-house, store-houses, and several boarding-houses. A heavy dam turns a large supply of water through a canal to the machine-shop, furnishing power for compressing air for ventilating the tunnel, operating the machine drills, etc.

Mr. A. P. Woodruff, a mining superintendent of long experience, has charge of the work in the east tunnel. We learned from him that the distance from the portal to the heading, was 4,800 feet, through solid slate. It is generally termed mica slate. Fine seams of white and bluish flinty quartz are frequently met with. It appears more irregular and tenacious than the ordinary slate rock of California.

ENLARGEMENT.

The first 2,400 feet was worked by Herman Haupt & Co., under contract with the T. & G. R. R. Co. Size, 15 feet wide by 14 feet high. This is being enlarged to 24 feet

wide by 22 feet high. From the 1st of Aug. to the middle of Nov. last, 1,400 feet was completed. About 170 men are employed, and from 1,500 to 2,000 cubic yards has been removed per month. The men work 11 hour shifts. Approaching this gang of men, their lights shining at various altitudes, give semblance of a lighted village located in a narrow ravine.

The tunnel is a very agreeable one for visitors,—so large, well ventilated and dry, that one actually misses the sensation of confinement usually experienced in more contracted excavations. For a short section, only, and that near the entrance, is water found dripping.

THE HEADING.

Beyond a distance of 2,400 feet from the portal, the tunnel is 15 feet wide by 6 feet high, for some 1,200 feet; but the heading is now worked 24x8½ feet. It follows the grade,—the enlargement is to be made from

gine, working independently and receiving its power (condensed air) through a 1¼-in. rubber hose. Weight of machine about 400 pounds. It contains eighty pieces.

The piston holds the drill, and is four feet 9 inches long; stroke, 9 to 10 inches; diameter of head, 4¼ inches; piston bar, forward of the head, 3 inches; in rear of head, 2¼ inches; air area, 8¼ inches when the drill is propelled against the rock, and 7 7-100 when returning from it; piston head packed with a ring of oak-tanned leather, held outward by a steel spring. Ports, 2½ by ¾ inches, opened about half way; cushion of 2 inches of air remains at each end to strike on; rotary valve; induction cock for stopping instantly.

The front part of the piston is a 3-inch steel bar, with 7-inch socket for taking the drill-stock. This socket is slit through on both sides, and sprung in by means of two bolts, causing the drill to be held by a some-

A PROFILE VIEW OF HOOSAC MOUNTAIN AND TUNNEL.

We give above a profile view, which will aid the reader of the accompanying letter in forming a just conception of the magnitude and progress which has been made upon this important work. A represents the western opening of the tunnel. Near this point two shafts have been sunk, from the bottom of one of which considerable progress has been made in drifting both ways. The adjoining shaft, which was commenced with the view of giving better ventilation, has not yet been completed. Work upon it is progressing from both top and bottom. About 1,000 gallons of water per minute are raised from this portion of the work. B is the west summit, which is 1,710 feet above the level of the tunnel. C is the central shaft, which is fully described in our correspondent's letter. D is the east summit, 1,249 feet above the tunnel level. E is the east entrance. The diagram is made to a scale of a little short of 3,500 feet to an inch horizontal, and about 700 vertical.

the top. At this heading, 4,800 feet, or nearly

ONE MILE FROM DAYLIGHT,

a grand mining spectacle is exhibited at "all hours" of "day and night." Eight air engine drills, pointing in various directions, are thundering away at the rate of 200 to 300 strokes per minute, the blows against the hard rock producing miniature meteoric showers of sparks. Add to this lively scene the occasional strange blasts, powerfully uttered by escaping compressed air, and the reader can faintly imagine the real sensation at first impressed upon the beholder of this great workshop in the "chambers of the earth."

THE MACHINE DRILLS

are attached to carriage frames fronting the heading, one on each side of the tunnel. These frames are about 20 feet in length, 6 feet high by 4 feet 8 inches wide, firmly braced; projection over forward truck, 8 feet; rear platform loaded with steel, extra drilling machines, etc., for ballast. When in operation the frame is raised so as to rest its entire weight upon jack screws.

On the forward end of each frame, four or more drills are attached, with universal motion. Each machine is a complete en-

gine, working independently and receiving its power (condensed air) through a 1¼-in. rubber hose. Weight of machine about 400 pounds. It contains eighty pieces.

THE MOVEMENT OF THE DRILL

is described as follows: On the back end of the piston is a section of a hall used as a cam, which works the valve and the feed-motion. The valve is rotated by a rod lying on the hand of the cylinder; upon this rod are two cams which perforate the hand of the cylinder. The action of the piston brings the ball on its end in contact with these cams, rocking them up and down; the rod to which they are secured being connected with the valve, imparts to that its motion. The machine is fed altogether on ways, or a bed-piece, upon which is the feed-screw; the feed-nut is upon the end of the cylinder-hand. To this feed-nut is attached a feed-ratchet, which is held between two collars, allowing it to turn round. Upon the cylinder-hand is a lever, one end of which passes through the hand; upon the other end is a pawl. The motion of the piston raises the lever up, pressing the end containing the pawl against the ratchet which turns the nut on the feed-screw, thus moving the machine forward. The rotating ratchet is in the hand of the cylinder and

has a spline in it, and a pawl on the outside. The piston having a spiral groove is turned by this ratchet as it moves down. On the return of the piston, the pawl drops into the ratchet and then the piston is turned. It makes one revolution to fourteen strokes. The piston is not encumbered with any machinery; it moves alone, and is the only part which receives the shock resulting from the blow; its area of air, as before stated, is greater on the forward than on the backward stroke; the alternation of the valve admits the air. Without change of drill-points, from thirty to forty inches advance can be made, and by changing, any depth of hole required may be obtained.

The machines are of 3-horse power, and when in perfect order, with a pressure of 50 pounds to the inch, are capable of dealing from 250 to 300 blows per minute. Considerable repairing is required, but by a quick method of adjusting the machines, and an extra supply of the same, all serious delay is avoided. They can be operated by steam. Air being quicker than steam, 30 pounds of the former is here considered equivalent in effect to 40 pounds of the latter.

WHAT THE MACHINES ACCOMPLISH.

It is over fifteen months since these drills were introduced. In four weeks one machine, without repairing, working but about six hours out of the twenty-four, including the time of changing the drill-points and positions, has made 2,250 feet of 2¼-inch hole. Alvah Crocker, chief superintendent, reports that, "notwithstanding the size of the heading has been increased, from 6x15 feet to 8½x24 feet, the actual progress for the last seven months has been 116 feet, against an average of 55 feet during the last seven months of hand labor. By hand drill, in the enlargement, two men average about 8 feet of 1¼-inch hole in 11 hours." In 6 hours the machines drill holes enough to employ the balance of the 24 hours in blasting and clearing away the rock knocked down. By hand labor \$28 per cubic yard has been the cost of excavating rock at the heading; it is now accomplished at less than \$8 with the aid of the machines.

A. T. D.

[Next week we shall give a description of the Burleigh Drill, referred to in the foregoing, which is now being so successfully used in the Hoosac Tunnel.]—EDS. PRESS.

IMPORTANT PATENT DECISION.—We clip the following from the New Haven Palladium, of February 21st: In the case of Eli W. Blake vs. Charles W. Stafford, which was an action in the United States Circuit Court for the district of Connecticut, for infringement of plaintiff's patent for jaw machine for breaking ores, etc., Judge Shipman rendered a decision on the 18th of February, at Hartford, in favor of the plaintiff. The decision was elaborate and able, and fully sustained the validity of the Blake patent.

The Age of Gold Bearing Rocks.

BY PROF. ROWLANDSON, F. G. S. L.

The long delay which has elapsed since the appearance of my last paper on this subject, has most probably led many persons to suppose that the series which had been commenced had somewhat abruptly terminated. The delay has chiefly arisen, because from information received, I was led to infer that not only, both here and in South America, there existed some probability that within a reasonable period, discoveries would be made calculated to show that auriferous and argentiferous veins, chiefly consisting of quartz, would be found penetrating tertiary strata. The most recently published researches, however, do not countenance such an opinion, especially as respects more particularly those which are gold-bearing. It is, however, asserted by several that, to a considerable extent, productive argentiferous veins are to be found in Chili, erupted amidst strata pertaining to the tertiary system. As regards this State and that of Nevada, so far as I can glean from others, the tertiary rocks in that part of the Pacific coast under notice, in place of increasing in area as researches are made, on the contrary diminish, assuming the form in most instances of outliers only, and generally of circumscribed extent, if we leave out of consideration the boulder, gravel, clay and similar superficial accumulations, of which are composed our hydraulic and placer mines, and also our arable, pasture and forest bearing lands.

TEMPORARY SUMMARY.

Whilst awaiting further information from Australia, New Zealand—perhaps Hindostan may be added to the list, as this extensive region has now for some time had the benefit of a geological survey, which is still continued under the able direction of an eminently talented gentleman, Mr. Oldham,—it will not be amiss to recapitulate some of the more prominent features associated with this subject, before a final retrospect is made; by which time I hope to be able to add the observations made by several independent observers who are usefully employing their labors and talents in extending our geological knowledge of Central and South America. We cannot leave this part of the subject without remarking, that it is to be hoped the Italian and Austrian governments will afford, as they certainly could do, great assistance in elucidating many points connected with the age and origin of gold-bearing veins, by directing some portion of their geological staffs in ascertaining the facts associated with the formation of gold veins in the Noric and Lombard Alps, Hungary and Transylvania; much of the two last auriferous districts pertaining to prolongations and spurs of the first named mountainous region.

From information recently obtained from a private source, I am more strongly inclined to infer, what I have suggested in former papers, that it is highly probable that a large portion of our Virginia, Georgia, and North Carolina gold districts, east of the Appalachians, will be found of similar geological age with the auriferous rocks on the Pacific coast.*

Beyond the instances just noticed, which are alluded to, however, as somewhat dubious, but which would be to the highest degree interesting if well established, I am not aware of any satisfactory case having been reported, that gold-bearing quartz veins are to be found penetrating rocks pertaining to a more recent geological series than the cretaceous, and those chiefly composed of Jurassic, or as they are more commonly known to England, as Liassic rocks. With respect to Australia, contrary to my anticipation, as geological surveys of that island-continent progress, the proofs, according to the opinions and reports of the various surveyors engaged thereon, appear to accumulate, that gold-bearing quartz ledges (as they are locally termed) are only to be found protruding through rocks of paleozoic age.

Admitting such to be the case, it may at the same time occur that the injected or deposited auriferous rock may not have been inserted until long posterior to the formation of the enclosing rock. Mr. Selwyn considers that some of the gold-bearing alluvial or placer gravels of Australia are as ancient as the eocene period; if subsequent investigations should fully establish this opinion, it would tend to show that the erupted auriferous rocks of Australia are probably amongst the oldest to be found on the face

of the earth, which is the very reverse of my earlier anticipations. To make this more fully understood, the reader may be reminded that in all other parts of the world, where gold has been found in placers, such alluvia or diggings usually consist of post-pliocene or modern superficial strata or drifts; in only very rare cases, and then generally under considerable doubt, to strata belonging to the upper pliocene period.

With only one exception, all the most recent accounts received from the Central American States, Mexico, and the west coast of South America, respecting the most prominent auriferous and argentiferous districts, tend towards establishing the impression that the chief mines of these celebrated bullion-producing districts are to be found associated with rocks of cretaceous and not of paleozoic age; thus completely negating the opinion which formerly prevailed, viz., that gold-bearing veins need only be looked for amongst the latter named series, an opinion which would not have so long held its ground had it not been for the fact that rocks which surround auriferous and argentiferous veins, even of the cretaceous series, are so metamorphosed in appearance as to strongly resemble those accompanying and generally found connected with gold-bearing strata when surrounded by silurian and other anciently deposited rocks, generally associated simultaneously or in near contiguity with igneous and metamorphic rocks of an allied character, the series common to both being ordinary hornblende and chloritic slates, mica (seldom in California), talc, hornblende chlorite, granite, porphyry, and the ordinary variety of accompanying minerals. Consequently no correct deduction could be drawn, or proof established, as to the age of auriferous rocks, in consequence of the lithological similarity existing in common with the rocks surrounding auriferous veins, whether protruding through those of primary or secondary age, until undoubted fossil evidence had been obtained; the first marked instance of which was the case of belemnites, etc., discovered near the Pine Tree lead on the Mariposa Estate, details of which, together with some confirmatory evidence appeared in my earlier papers on this subject. Awaiting further and fuller information from various parts of the world, before closing the series and terminating the same with some general observations respecting the possible elucidation which a fuller consideration of this subject may eventually throw upon the origin of what is usually understood by the term metallic mineral veins, I shall for the present cease the continuance of this series for some time to come. It will not, however, be out of place to insert, by way of a temporary conclusion, a short quotation from Humboldt, which is calculated to illustrate two points, which are very little comprehended, viz., the feasibility of wearing out the hardest rocks and their distribution by aqueous influence in beds which subsequently become placers by alternations of the level of the land. What follows, is that celebrated traveler's description of the character and appearance of the river Orinoco, above one of the most celebrated cataracts (that of Carwen):

"The next day they found the bed of the river to the length of 3,600 feet, full of granitic rock. They passed through channels that were not five feet broad. The canoe was sometimes jammed between two blocks of granite. When the current was too violent to be resisted, the rowers leaped into the water, and fastened the rope to a point of a rock, to warp the boat along. This manoeuvre was very tedious, and the travelers sometimes availed themselves of it to climb the rocks amongst which they were entangled. The rocks were of all dimensions, rounded, very black, glossy like lead, and destitute of vegetation.

It was an extraordinary phenomenon to see the waters of one of the largest rivers on the globe in some sort disappear. They perceived, even from the shore, those immense blocks of granite rising from the ground, and leaning one against another. The intervening channels in the rapids were more than twenty-five fathoms deep; and were the more difficult to be observed as the rocks were often narrow towards their bases, and formed vaults suspended over the surface of the river," thus clearly evidencing the abrading influence which flowing water is capable of exercising.

The preceding paper has been written the larger part of a year, but has been withheld from publication in the hope that when Mr. Atwood returned, a series of papers connected with the same subject published in the *Quarterly Journal of the London Geological Society and Magazine*, written by D. Forbes, would arrive. A series of these publications, however, was lost at the Trent at the late convulsion at St. Thomas. A new edition of *Siluria*, by Sir R. Murchison, Bart., has just appeared, in the advertisement announcing which, additional information respecting gold production is promised. A final paper on the subject will be withheld until the writer has had an opportunity of perusing the publication alluded to.

(Written for the Mining and Scientific Press.)

A New Mining Enterprise.

MUD SPRINGS, March 18, 1868.

EDITORS MINING AND SCIENTIFIC PRESS: In traveling from Jackson, northward, through Amador County, we pass through Hayward's at Sutter; Amador City, with its famed Knickerbocker mill; through Drytown, and its present dry mills, (though it is said the Drytown mine has lately struck good rock, which, being so, it will not stay dried up long) up to Hooper's, which has been the last of the line of mills, northerly, on the main mother lode of the State. But continuing our course north, on the line of quartz and slate, we strike the forks of the Cosumnes. Just before reaching there, you pass an unpretentious settlement, called Enterprise; and it might have been started by enterprising people, but they have died out. There is a small mill here called "Enterprise Mill," which has not done anything as yet, their mine not being sufficiently opened; but from the character of the substances thrown from their mine, I should judge them to be on the correct strata. The road crosses the Cosumnes at Yesmet on a wire suspension bridge, which seems much out of place in this sparsely settled country, where scarce a traveler a day looks over its imposing height to the wild seething waters below. About two miles above the bridge, on the north fork of the Cosumnes, is Nashville, not known by 100 people outside of El Dorado County, to have ever been in the State; yet here was once a large population; here was almost, if not the first quartz mill in the State. Its machinery was transported across the Isthmus on muleback. It has been the seat of five quartz mills, three driven by steam, and two by water, of all of which there is now no trace but a pile of heavy shafting, with flanges, cams, couplings, gears, etc., and tradition saith that fifty arastras supplied the ore for the "table," the "saloon" and the "dance house," till the place overflowed with hilarity and recklessness. The rock to supply all these grinders was obtained from a ledge or ledges on the east side of the river, called the Havilah, the Cascade and Montezuma mines. Now, how changed in Nashville; a few easy-going residents were still clutching their golden ledges, even in starving despair. In August last some San Francisco capitalists came to look at the pioneer of quartz ledges, and arranged to buy, conditionally.

They put up small hoisting works, and sunk a shaft from the surface, on an incline of forty-seven degrees—ninety feet, to the water level of the old works. About this time, there seemed to be a disagreement among them, and the work stopped, being idle six weeks, when it was announced that the Havilah Co. had bought the Valle del Oro mill, at Grizzly Flat, and were about to move it to the mine; and true enough, in two weeks time, El Dorado County was strung with teams from Grizzly Flat to the Cosumnes, bearing all of a 40-stamp mill to its new destination. Before everything was delivered, though, the rains had set in, and the do-nothing people shook their heads, "they will not be able to do it this season." But the parties having it in hand were not to be deterred by trifles, notwithstanding the stranding of teams, breaking of axles, miring, sliding and slashing; all the work was got on to its new site, but part of the building material. That had to be provided. All the sawmills in this section had shut down as soon as rain began to fall; but there was found a man with enough of the Yankee in him to reset his mill and go to work, even in the rain. And Farnham, of Fiddletown, has furnished for the building of that mill and other buildings, 100,000 feet of lumber, delivering it all through the winter with scarce any regard to weather or water. Now there stands opposite Nashville, on the Cosumnes, about eight miles south from Mud Springs, the best 40-stamp mill there is in California, with a mine whose surface has sown gold broadcast. At the same time, while building the mill, they put up a larger engine and boiler for the hoisting works, and having retimbered all the old workings, are now sinking a shaft 100 feet lower to develop the mine, and get it sufficiently opened to furnish the rock that forty stamps will steadily require.

The mill is situated 300 feet from the incline. The rock is hoisted in the cars, runs on a tramway on a safe incline to the top of the mill, and is dumped into shutes that direct it in piles before each 10-stamp battery. The mill building has been erected on a

rounded point of the hill, high up, with special reference to having everything go through by gravity. It is all down hill from the time it comes out of the mine, till it is finished in the chlorination tubs and sluiced into the tailing reservoirs.

The machinery is driven by a 14-inch cylinder engine, supplied by two 42-inch tubular boilers. The steam is superheated by Carvalho's arrangement. The engine sets in a solid mass of stone work eight feet deep, and is as solid as the hill. Three sets of the mortars for 30 stamps, are the low mortars with wood housings, but two mortars are entirely iron, made expressly for gold, from a plan originating with the Superintendent, for which he has filed a caveat. The pulp, after leaving the screens, drops on an inclined copper shelf of eighteen inches wide, from thence on to two coppered inclines, one running north, the other south, each five feet long, fourteen inches wide. At their termination, the stuff drops to another coppered shelf of same length and width, running to the center again, and so on, zig zag down over six sets of shelves, each projecting its width beyond the other, running over sixty feet of copper in the space of the battery ports, and eight feet in width. It is then distributed into a level trough which sets directly over the heads of a series of twenty percussion concentrating tables, five for each battery of ten stamps; small sliding gates under this trough allow the pulp to be distributed on to the concentrators. A long line shaft, with twenty cams on it, gives motion to the tables, moving each out eight inches, from whence it drops back against a timber called a butt, each table taking its turn and dropping as regular as the crushing stamp. The whole has the appearance of a wave of the sea on shore, and in its action the effect is similar, leaving the heaviest matter, and carrying off the light. In front of the concentrating tables, a tram-road is laid, and a small car receives all the sulphurcts as shovelled from the tables and transports them to the furnace.

The supply of water is obtained by a direct action, steam pump, drawing from the river; of five-inch diameter, and eight-inch stroke, throwing water both ends of stroke, with velocity of 9,000 gallons an hour. Besides, they have all the water of the mine discharged at the top and conducted into a large tank, from whence it is taken by a four-inch pipe for distribution in the mill. At the mill, the water is divided and taken in two-inch pipes. One leads through the exhaust pipe to warm the water and delivers into the mortars; another runs immediately in front, a little below the level of the bottom of the screens, and the water projects against the screens from small holes in the pipes, each mortar having a cock at each pipe to regulate its supply. Another two-inch pipe leads the length of and above the concentrating tables; from it drop smaller pipes over each table, terminating in a T just above; this is also perforated with holes, so that the tables can be showered to clear them and wash off the lighter substances. Another pipe leads to the chlorination room. The desulphurizing furnace is double; has two hearths on the reverberatory plan, and two series of ten separate ovens over each furnace. The ore is put into hoppers on top, from thence drawn or dropped on the top oven, where it gets sufficient heat to dry; it is then drawn and drops on the next, and so on as it gets heated; it is moved from one to the other till it reaches the main hearth, nearly cooked for discharging. The plan for this was furnished by J. Mosheimer. After being sufficiently roasted, the ore is drawn on the back side on to a sheet iron floor, mixed, cooled and dampened, placed in the tubs, of which there are five, so placed that the ore can be scraped into them, and then subjected to the action of chlorine gas. The gas is generated in lead generators, which are on a floor below the level of bottom of the tubs; the generators are set in wood boxes, and heated by steam. The liquor leached from the ore is drawn into a trough, discharged into a receiving tub, and the gold precipitated. One end of the chlorination department is fitted up in two rooms for a laboratory, where there is everything necessary for assaying and analyzing their ores; the whole arranged and fitted up in the most complete manner. On viewing the whole of these works, I could not but admire their simplicity and compactness. Every arrangement has been made to economize in labor and supplies, and the whole forms the neatest and best arranged mill now in California. Indeed, it might be pronounced "a model mill." The designer and Superintendent of the Havilah works, is Mr. Hyde, to whom we are under obligations for so obligingly showing us all of the improvements, and giving us some of the history of the undertaking. Yours, EL DORADO.

*It has been related by several that at some of the deep hydraulic claims in this State, gold bearing quartz lodes are intruded into the superposed gravel in such a manner as to lead to the strong inference that such protrusion occurred after the deposition of the gravel. An interesting relation of a very remarkable case of this kind in his paper inserted in this Journal of the 19th October last.

Mechanical.

The "Watt Equivalent"—The Unit of Power.

It is proposed to introduce a new dynamic unit called the "Watt Equivalent," in place of the old "horse-power,"—which is vague in its signification. Watt's experiments having led him to conclude that the average labor of a horse is the draught of 150 pounds at the rate of two miles and a half per hour, he reduced this to foot-pounds, as a measure of power. One hundred and fifty pounds of force, exerted at the rate of two miles and a half per hour, or 220 feet per minute, is the same as 33,000 pounds exerted at the rate of one foot per minute, or, in other words, 33,000 foot-pounds. The actual horse-power of a steam engine, must, then, be the mean pressure in pounds on the cylinder piston, multiplied by the velocity of the piston in feet per minute, divided by 33,000. From this about 13 per cent. is deducted for working friction, and in condensing engines, a further deduction of 12 per cent. is made for the power required to work the pumps.

It is evident, that the same engine, by varying the steam pressure and the speed, within the limits of safety, may be made to exert widely different degrees of actual power. The above calculation, therefore, only determines the rating of the engine, under the conditions which the builder or owner chooses to prescribe; and depends, moreover, much more on the boiler than the engine. Theoretically (and practically too, within the limits of safety and practicable speed) a small engine may show as many actual horse-powers as a large one. This classification affords therefore no constant or convenient method of comparison.

To supply this want, the notion of a "nominal horse-power" has been adopted. The nominal horse-power is a function of the size of cylinder and length of stroke. The theoretical unit here is the same as before—33,000 foot-pounds; but its use at all in this connection is a source of confusion and deception. The whole value of the term "horse-power," as *Engineering* says, consists in its meaning exactly what it professes to mean. The necessity for the proposed change is plainly apparent.

IMPERISHABLE IRON.—In a recent lecture by Mr. Wm. McAlpine, before the Polytechnic Association, of the American Institute, he spoke of white iron as being almost imperishable; and as being therefore most suitable for piles. Iron piles even of gray iron are now standing in some places in Europe which, after the lapse of fifty years, are as perfect as when they left the foundry. Corrosion is due to an improper quality of the iron. Mr. McAlpine mentioned that some water pipes at Albany, N. Y., which he had recently taken up after being buried and used for twenty years, were so sound that he had again inserted them with new pipes, and they were in all respects equal to the new.

IMPROVEMENT IN MAKING MALLEABLE IRON.—In making malleable iron from cast iron, if silicon is present, whether in combination with the iron or in the form of sand adhering to the pig, the formation of oxide of iron is required to effect its separation, in the form of tap cinder or basic silicate of iron, and this oxide is obtained at the expense of the metal. The sand which adheres to the pig thus causes a loss of from three to seven times its own weight of iron. Not only is there this loss caused by oxidation, but the time, labor, and fuel required to effect it is thrown away. It is, therefore, desirable that the presence of silicon, whether in the form of sand or otherwise, should be avoided. To prevent the loss of metal from this cause (generally amounting to from three to six per cent.), the iron is run from the blast furnace into beds of granulated or powdered iron ore. By this not only is the loss of metal reduced, but the time, labor, and fuel required to puddle it are also appreciably diminished, the iron is somewhat improved, and the production of tap cinder diminished. This improvement has been patented.—*Mechanics' Magazine*.

CAST STEEL BOILERS.—Experiments were recently made at the rolling mills of Messrs. Funk & Elhers, Hagen, Prussia, for the purpose of ascertaining the respective evaporating capacity of iron and steel boilers. Two new boilers, one of wrought iron, and the other of soft cast steel, each five feet in diameter, and thirty-four feet long, and so made as to stand five atmospheres "over" pressure, were used for the experiment. Each received exactly the same amount, in cubic feet, of water at the same temperature; both were treated throughout in the same manner, and the firing so regulated, by means of dampers, that the velocity of the steam when allowed to escape, was the same from each boiler. The same amount of coal was used for each. At the close of the experiment, which occupied several hours, the amount of water which had been evaporated by the iron boiler, was found to be 20,065 pounds, while that evaporated by the steel boiler, was 23,523 pounds. This amounted to 6,350 pounds for each pound of coal used in the first, and 7,467 pounds for same quantity in the last.

A second trial gave nearly the same result. A third experiment was made in verification of these, in which equal volumes of a strong solution of salt were used in the two boilers, to equal quantities of water. Analyses after evaporation, showed 20 per cent. in favor of the steel boiler. The average percentage of these three experiments was 19.24 per cent. The steel boiler had a shell one-third thinner than that of the iron.

RICHARDSON'S STEEL MAKING PROCESS. This consists in introducing air into the melted metal by means of the iron rake or "rahle" used for stirring it. This is tubular, and has a broad slit half an inch wide, and three or four inches long, through which the air passes. It is connected to the air receiver by a long india-rubber tube. The air is turned on before it is introduced, and kept on until it is withdrawn;—to prevent the aperture from being choked with cinders. By this arrangement, the iron has been brought to a "hoil" in ten minutes, instead of thirty, as by the usual one. The whole process only occupies one hour and a quarter; and the quality of the metal is said to be superior.

FILE HANDLES.—If file handles become broken, or split, throw them aside. It is true they might be repaired by wrapping a cord or wire around them, or inserting a nail or screw; but at the best they present a "botched" and sorry appearance, which is not befitting a neat workman. Seasoned maple makes the best handles, and a stout ferrule of brass or iron ought to inclose the end. Where the handles are not hored, and the mechanic would do it himself, let him disdain to employ any other means except a narrow chisel to fit them. Driving is sure to split handles, and burning with an old file-shank is unworthy of a workman. Use handles appropriate and proportioned to the tools for which they are intended, take time and care to fit them properly, and experience will testify that they will give better results and last longer; proving that "haste makes waste" even in the small matter of fitting a file handle.

"DUROMETER."—This is the name of an instrument for testing the hardness of steel rails. One was exhibited at the Paris Exposition. It is essentially a small drilling machine, so constructed as to register both the "feed" and the number of revolutions of the drill.

HARDENING MILL PICKS.—The following is considered an excellent bath for hardening mill picks: 2 gallons rain water, 1 oz. corrosive sublimate, 1 oz. sal ammoniac, 1 oz. saltpeter, 1½ pints rock salt. The picks should be heated to a cherry red, and cooled in the bath, without drawing the temper.

VERY HARD IRON.—Mr. Goudin, who some years ago made hard iron by combining with it a small quantity of boron, has now produced an article equally hard, by the use of phosphate of iron and peroxide of manganese. It cannot be forged, but is easily cast.

Scientific Miscellany.

CARBONATE OF SODA.—M. Kessler has patented in France the following simple and apparently economical process for making carbonate of soda. Common salt is first intimately mixed with sesqui-oxide of chromium, either alone or with oxide of manganese. Chromate of iron or chromate of lead may be used, and perhaps a good chrome iron ore. The ingredients are heated to redness in a furnace and subjected to a current of steam. The hydrogen of the steam unites with the chlorine of the salt, forming hydrochloric acid. When the evolution of hydrochloric acid gas ceases, the charge containing chromate of soda is withdrawn, and, after being mixed with a proper proportion of coal, is again heated without steam, when sesqui-oxide of chromium is reproduced, and the carbonate of soda thus formed is separated by lixiviation. The sesqui-oxide of chromium is again ready to be mixed with salt, and may be used for an indefinite time.

AUTOMATIC LIGHTNING GUARD.—At the late Paris Exposition, T. Picco, of Alexandria, exhibited a novel construction of lightning guard, called automatic. When the atmospheric electricity enters a telegraph station, it fuses a short piece of thin iron wire, and by this releases a spring, which puts the line directly to earth. The end of the line is connected with a brass pillar, on the top of which a metallic beam turns horizontally. One end of the beam is pressed against a contact leading to earth by means of a helical spring round the pillar. When in use, the other end of the beam is secured by about an inch of thin iron wire to the terminal leading to the apparatus separating the beam from the earth contact, to which it, however, returns as soon as the wire is fused.

FUNCTIONS OF THE ROOT.—M. Corenwinder read a memoir before the French Academy on the functions of the roots of vegetables, in which, he concludes from experiments made by him, that the root does not obtain all the carbonic acid found in it by absorption. On putting the roots in communication with a certain proportion of this acid, either in a gaseous state or in solution in water, he invariably found the quantity present in the roots greater than that which had been supplied to the plant.

UTILIZATION OF COAL GASES.—Messrs. Carver & Co., of St. Etienne, France, have successfully utilized the gases given off in converting bituminous coal into coke. The gases are collected, drawn off through pipes, and cooled. From the liquids condensed, benzene, naphthalene, sulphate of ammonia, and several dye-stuffs are made, and the uncondensed gas is used for illuminating purposes. The process is said to give a profit of 50 cents per ton, and if applied to all the coke made in France, would effect a saving of \$2,000,000 annually.

VAPOR OF MERCURY.—An atmosphere containing vapor of mercury is fatal to plants. The remedy is sulphur,—which neutralizes the mercurial vapor by combining with it, and forming sulphuret of mercury. If sprinkled over the leaves of plants exposed to such an atmosphere, its yellow color will be gradually changed to gray, while the plants continue to flourish. Medallions, and other articles cast in sulphur, are made to assume a metallic appearance by exposing them to vapor of mercury.

A NEW COLOR.—A new green color is prepared by M. Wiederhold, by mixing a neutral soap of linseed oil with a salt of copper in solution, or by combining directly the fatty acid of the oil with oxide of copper. A paste of a fine green color is thus obtained, which may be immediately employed for calico printing, etc. It can be diluted with spirit of turpentine or benzole until it has acquired the necessary degree of fluidity.

THE METAL THALLIUM.—Thallium is the softest of the alkaline metals, and may be scratched by a point of lead; it melts at 550 degrees Fahrenheit, and can be easily fused over a gas jet, its surface being protected from the air by a stream of cool gas. In appearance it resembles lead, is of a bluish-white color, and leaves a trace similar to lead on paper, and has about the same density. Its solutions, like those of lead, yield a black precipitate with sulphuretted hydrogen, a yellow with iodides and chromates, and a white one with chlorides. The metal was first publicly shown at the London Exhibition in 1863, and the same year a mass shown which weighed about a quarter of a hundred weight. It has been suggested that one of its uses may be to furnish a green flame, which might be used for signals. Eight parts of chlorite of thallium, two of calomel, and one of resin, yield a splendid light on being ignited; its extraordinary intensity and mono-chromatic character enabling it to penetrate through a hazy atmosphere, which alters altogether the color of the ordinary green lights produced by the salts of baryta.

DETECTION OF FIRE DAMP.—Mr. Ansell's plan was based upon the diffusion of gases. His apparatus takes various forms, the most simple being a thin india rubber balloon full of atmospheric air, having a ligature of linen bound round its equator to prevent its lateral expansion. This being placed in any part of the mine, it is proposed to connect it by a wire with any ordinary electrical bell at surface. As the balloon expands upwards by the diffusion of the carburetted hydrogen into the air which it contains, it releases a catch, and connection being made by a simple mechanical arrangement with the electrical or magnetic apparatus, the bell is rung. After this signal has been given, the fire-damp indicator has only to be removed for a few minutes into good air, and it is restored to its original state.

PRE-HISTORIC IMPLEMENTS.—An important discovery has been made at Bordeaux and communicated to its Scientific Academy. Within the space comprised between the rues Victor and Trois-Conile on one side, and du Paugue and Rohan on the other, a pre-historic lacustral station has been discovered. M. Delfortrie assigns an age of seven or eight thousand years to this station, marked by a thick bed of ashes covering a prodigious quantity of oyster shells, mixed up with flint hatchets and implements in perfect preservation, and what is most remarkable, handles of instruments of weapons made out of metatarsal bones sawn half-way through the middle of their diaphyses. As the station bears a strong relation to the Kejolenmoddings, of Denmark, it is therefore older than the lacustral villages of Switzerland.

CONIFERINE.—The *Journal des Connaissances Medicales* describes as follows the preparation of coniferine, extracted from fir. The wood is stripped of its bark, rasped, and subjected to the action of a press. A thick juice is thus obtained, which, after being heated, strained, and evaporated, deposits its crystalline needles of coniferine, which is bitter; the mother ley, on the contrary, is sweet. The crystals are redissolved in water, dissolved by lampblack, and then recrystallized in weak alcohol. Coniferine is but little soluble in cold, but dissolves readily in boiling water; it is scarcely soluble in alcohol, and not at all in ether. The watery solution is bitter, is not precipitated by the acetates of lead, and gives no color with perchloride of iron. Treated with concentrated sulphuric acid, coniferine changes from white to a deep violet.

GAS FROM A VOLCANO.—M. Fourné succeeded, after great trouble, in collecting some of the gas which arose from the sea during the volcanic eruption of the Azoree in June last, which he has found to be entirely free from carbonic acid, and rich in oxygen.

PHOSPHORUS.—People who are engaged in the manufacture of matches, must have perfectly sound teeth. If their teeth are at all decayed, the phosphorus, which has a great affinity for bone, attacks their interior surface, ultimately causing, in some cases, caries of the jaw.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

74,630.—WATER HEATER FOR BATHS, TUBS Etc.—William H. Thomas, Sacramento Cal.

I claim a steam-coil heating furnace, submerged in water, and supplied with air from the top, and provided with a tank, E, and deflector *b*, all constructed and arranged substantially as herein shown and described.

74,281.—IMPROVEMENT IN FIRE ESCAPE LADDERS.—Daniel Hayes and William Free, San Francisco, Cal.

We claim the combination and arrangement of the curved and grooved arm *a*, with the hinged ladder *C*, winding-roller *I*, rope *H*, and platform *B*, substantially in the manner shown and described, and for the purposes set forth.

The object of this invention is to provide a ready means of sending up or elevating ladders to a greater or less height against a burning building, so that the inmates may escape or the fire be subdued. To accomplish this a common carriage is provided, with a rest or holder upon the back part, on which a series of ladders are placed when not extended for duty. At the front end of the carriage is placed a turn table. Trunnions are attached to each side of the ladder, operating in upright pillow-blocks, pivoted upon the turn-table. Back of the trunnions and pillow-blocks is placed a hand roller, resting in upright standards, with a cord or chain passing around it, which extends over a pulley in the upper end of the main ladder, both ends of the rope being fastened to a clip which is attached to a second ladder, which slides along the first or main ladder by using the hand roller. Extending from the turn-table, placed back of this hand roller, is another roller, having its bearings on curved arms. This roller has a ratchet, in which a pawl works, having its bearings on a standard upon one of the curved arms. A cord or chain, one end of which is attached to the roller, and the other end to the lower round of the main ladder, passes over a hese-plate with a grooved, curved arm, by which the ladders are raised at the desired angle.

RECENT INVENTIONS.

IMPORTANT PHOTOGRAPHIC IMPROVEMENT. Mr. Joseph Buchtel, of Portland, Oregon, has recently devised what is said to be a very important improvement in printing pictures from negatives. The invention is described in the *Oregonian* as follows:

There has already been a complaint among photographers, that no perfect arrangement was known, by which an accurate, clear and sharp impression could always be taken. The trouble has always been that no contact pad has been invented which would hold the sensitive silver plate on which the pictures are printed, in perfect, air-tight contact with the negative glass. Every one has noticed that nearly every picture, even among the best, is blurred or indistinct in some of the minute lines. This is because the silver paper was not closely pressed in those parts upon the glass plate. The pad generally used is of felt, the finest of which has small pits and inequalities in its surface. Wherever there is a pit there will be a defect in the picture. If there are 100 of these little pits in a square inch, there will be 100 places in the picture where the minute lines are not brought out, and hence a blurred appearance. The platen board, over the pad is perfectly straight; now if the negative glass on which the pressure is brought, be warped, it is plain that some places will be pressed hard, while others will not be pressed at all, or only lightly. Then the picture will come out sharp and clear in the hard pressed places and blurred in the others. Such pictures are valueless, and hence there must be great waste of silver paper, as well as of the time of the operator. This invention is designed to take the place of the felt pad in common use. It consists of an elastic bag, made of very fine, soft and pliable india-rubber, air-tight, in two compartments, which lap each other by means of an ingeniously arranged suture. This bag may be filled with air, gas or any fluid. It will be used in the same manner as the old pad. The negative will be laid in the printing frames, the silver or sensitive paper laid on the negative, next the pad and

then the pressing hoard or platen. Every photographer will see at once that the elasticity of the bag will accommodate its surface to that of the negative glass. That is to say, if the glass is convex, the air or fluid in the bag will flow, under the pressure of the platen to those places which are low, and the surface of the bag will become an exact impression or counterpart of the glass surface. No part of the negative's surface, no matter how uneven it may be, can escape the pressure, and the pressure will be exactly equal everywhere. There will be no vacuum between the pad and silver paper, nor between the latter and the negative glass, hence there will be no discoloration of the silver paper which always occurs from exposure to air. These are not all the advantages which are secured by Mr. B's invention, but they are sufficient to recommend it to universal use, the cost being inconsiderable. He has taken the proper steps to secure a patent. Since the art of photography has been known, hundreds of attempts have been made to find a contact pad which would secure the results which Mr. Buchtel's claims will invariably follow the use of his invention—but heretofore without success. It is simple in its principles of operation, and the only wonder is that it had not been thought of long since.

SHEEP SHEARING BY MACHINERY.—Much ingenuity has been expended, within the past three or four years, to get up an efficient device for shearing sheep by machinery. Several machines have been for some time before the public, and others are still coming forward with what are claimed to be additional facilities for effectiveness. Mr. D. Peterson, of Fredericktown, Md., is among the most recent inventors in this line. He asserts that with his machine one man can shear about as fast as another can catch and bring forward. Another man in Nashua, N. H., name not given, claims to have a machine with which he has sheared a sheep in three minutes. Machinery is constantly improving and enlarging human resources; and a fine field for invention is opened in this growing department of industry. Whatever tends to cheapen or facilitate labor in any department of husbandry, adds materially to the general wealth of the world.

DESIGNS.

2,915.—BOTTLE.—Louis Lacour, San Francisco, Cal.

MAMMOTH BELT.—The fact that good and reliable belting is being manufactured in this city, must be of interest to all who use that article. It is a business which requires the best of hides, well tanned, and carefully selected; the prime and solid parts only being suitable. We have visited the establishment of M. M. Cook & Son, corner of Battery and Broadway, and witnessed the various processes of stretching, cementing and riveting. They had just completed a belt for Marsh, Pillsbury & Co., double thickness, 24 inches wide and 150 feet long. This belt alone required eighty-two of the heaviest Spanish hides, weighing nearly two tons, and is probably the largest on this coast. It fully demonstrates their capacity, and shows the important fact that such things can be done here at short notice.

HARDENED PLASTER OF PARIS.—A correspondent of the *Scientific American* says that he has found by experiment that plaster of paris mixed with iron filings, makes a coherent mass of oxide of iron, which is very firm. The idea is, we believe, not new. We saw in New Haven, some twenty years ago, a garden walk, which, if we mistake not, was made of plaster of paris mixed with the turnings and borings from a gun-barrel factory. It was perfectly solid,—and had been exposed to the weather for years, without any signs of disintegration.

EFFECT OF ELECTRICITY UPON MELTED IRON.—At a recent meeting of the Polytechnic Branch of the American Institute, Prof. Fleury stated that the result of passing a strong current of electricity through molten cast iron, was such that it could be made directly into steel or wrought iron. The experiment had been lately made in Paris, and with great success. The Professor, however, claimed priority, as his original experiments date back six years.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,
March 28, 1885.
CITY STOCKS.

In this class of securities the market continues quiet. Sales of San Francisco Gas stock were made at \$69.50, Spring Valley Water at \$62, and California Steam Navigation Co. at 70@71 per cent. North Beech & Mission Railroad stock was in the market at \$59 and \$60, buyer 5. The Merchants' Mutual Marine Ins. Co. will hold their annual meeting for the election of Directors on Thursday, April 2d. We refer the reader to our quotations of city stocks.

MINING SHARE MARKET.

The interest manifested in the mining share market during the past week has been rather on the increase than otherwise, and the list of stocks dealt in embraced twenty-three different companies, nearly all of which sold quite freely on nearly every day of the week. Those claims located in the Gold Hill district have been eagerly sought for at enhanced rates, and cover by far the greater proportion of transactions, while a very large business has also been done in the Virginia claims. The desire to invest where the prospects of an earlier ascertainment of the existence of ore in localities yet unexplored is largely in favor of Gold Hill. At present, the lower drift from the Imperial-Empire shaft is in upwards of twenty feet, and it will not take many months to know the true nature of the ground.

HALE & NORCROSS—is in less favor, some twenty odd shares changing hands in the Board, declining from \$2,750 to \$2,550, buyer 30, on the 26th inst. The present daily product of this mine is about 100 tons, and during the past week the average yield ranged from \$32 to \$38 per ton.

SAVAGE—continues to be largely dealt in, declining to \$150, advancing to \$164, receding to \$154.50, then selling at \$167, and closing at \$166. For the week ending March 21st, the ore product amounted to 1,095 tons, showing an average assay value of \$34.27. Of this amount, the north mine on the third station yielded 603 tons, and the south mine 208. Above the third station the main breasts are said to show considerable improvement, chiefly in the south mine.

OPHIR—experienced a very material advance, rising from \$199 to \$232.50, dropping to \$190 under a strong "bear" movement, rallying to \$225@215, and at the close selling at \$217.50. The foundation work at the new shaft for the pumping machinery is put up in a strong and substantial manner, and it will not be many weeks before the pumps will be in operation.

OVERMAN—was in good request at an advance, gradually improving from \$165 to \$185, declining to \$179, advancing to \$189, and closing yesterday at \$183. From the time work was resumed in this claim, on the 11th of February to date, the receipts of bullion aggregate about \$38,000, of which amount \$12,536 came to hand since our last issue. Reports are favorable concerning the 500-foot level. It is reported that some good ore is coming in on the 300-foot level.

GOULD & CURRY—met with less inquiry, selling within a range of \$625@600, and at the close realizing \$630. The ore on hand on the 1st instant, amounted to about 4,000 tons, and this amount has been augmented at the rate of twenty-seven or thirty tons per day. It has surprised the best informed that the yield of the old chambers has continued so long, and that they still promise well.

CROWN POINT—has been in fair request, advancing from \$2,000 to \$2,300, receding to \$2,100, again rising to \$2,300, and closing at \$2,250. The winze from the 700 to the 800-foot level is seventy-four feet in depth, carrying ore assaying from \$60 to \$280 per

ton, as per daily report. The drift on the 800-foot level is now forty-two feet from the west clay, and on the 21st instant, they passed through ten feet of ore, said to be worth from \$32 to \$34 to the ton, while some sixteen feet east the face of the same drift is again in good ore.

IMPERIAL—rose from \$260 to \$272, declined to \$263, and at the close sold at \$262. The receipts of bullion for the current month to date aggregate \$27,863 27. The product of ore is about the same as heretofore reported, eighty to ninety tons per day. The ore in the west drift does not improve in running north on it. The drift on the lower level is in and timbered about twenty feet from the shaft, and they will be ready to start separate drifts about the first of April.

KENTUCK—sold quite freely at an improved figure, rising from \$395 to \$450, then selling at \$420, and closing at \$420. Of the February yield, amounting to \$69,525 50, it required \$52,092 42 for expenses, etc., leaving a profit of \$17,433 for the month. For March account the first shipment of bullion amounted to \$5,641 88.

CHOLLAR-POTOSI—receded from \$262 50 to \$245, and closed at \$251. The ore product for the week ending March 19th amounted to 249½ tons, and during the same time 262 tons were sent to the mills. At the new shaft the bottom station is completed, and a start has been made on the incline.

YELLOW JACKET—sold at \$1,475@1,390, then at \$1,460, and closed at \$1,437 50. The drift on the Kentucky line is said to show very good ore.

BELCHER advanced from \$385 to \$400, receded to \$370, and closed at \$365. An assessment of \$25 per share was levied on the 13th instant. . . . CONFIDENCE was in the market at \$80@82. An assessment of \$10 per share was levied, payable on the 26th inst.

SEGREGATED BELCHER—was in the market at \$20@17 50, closing at \$19. Work is about to be resumed in this mine. Bodies of ore are said to exist on the 500 level, and so soon as reached, and the same level from the Overman ground is opened to the line, the ore will in all probability be raised through the Overman shaft.

EMPIRE—sold at \$285@280. . . . ALPHA rose from \$72 50 to \$85, then sold at \$82, and closed at \$84. . . . EXCHEQUER advanced to \$51, receded to \$49, and closed at \$50. . . . BULLION improved to \$83, and closed at \$80.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEER & JESSUP, corner of Montgomery and Sutter streets, over Tucker's Jewelry Store, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with PURE GOLD—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14-1f

Miners, Visitors to mining districts, R. R. EMPLOYEES, and TRAVELERS generally, should insure against all Accidents in the Traveler's Life and Accident Insurance Company of Hartford before leaving the city.

WM. MACDONALD & CO., Gen'l Agents,
7v16-q3p 121 Montgomery St., opp. Occidental Hotel.

Accidents.

The Traveler's Insurance Company, of Hartford, Ct., insures against death or disabling injury by accidents; \$3 to \$50 per week paid the assured in case of injury preventing the prosecution of his business; \$500 to \$10,000 paid to his family, or legal representative, in case of his death by accident. No medical examination required. WM. MACDONALD & CO., Gen'l Agents, 121 Montgomery St., San Francisco, Opposite Occidental Hotel. 2v16-3m

MEDICAL AUTHORITIES have announced that not less than one-fourth of the entire population of the United States are afflicted with Neuralgia in some form. Surely the man who can safely remove such a vast aggregate of pain is a great public benefactor. Such is Dr. Turner, of Boston, in Massachusetts. His "Universal Neuralgia Pill" is pronounced on all hands, to be an entirely harmless and perfectly certain remedy for this most torturing of all known diseases. See advertisement in another column.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press PATENT AGENCY has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Amador County.

Ledger, March 21st: Mr. Bigelow, who resides about three miles from this place, on the banks of Jackson Creek, informs us that he has struck diggings on his ranch from which he is taking out \$8 per day to the hand.

The Mahoney mine, located on Sutter Creek, has been sold to parties in San Francisco, for the sum of \$250,000.

Calaveras County.

Chronicle, March 21st: The Mokelumne Hill correspondent writes as follows: In my last communication I omitted to mention a mine on the north extension of the "Quartz Glen." It is called the "Houston claim." This mine was worked, to a considerable extent, up to the time of the destruction of Quartz Glen mill. Since then there has been but little work done, though I am informed that all of the rock worked at the time paid handsomely.

The next claim in importance, is the south extension of the Anglo Saxon mine. This ground is owned by Messrs. Pickering & Rider. The claim is very rich, though the work, as yet, is superficial. There are three openings in this mine. The greatest depth reached is 45 ft. The rock in all of them has the same characteristics, which are peculiar to this lead, viz: a large amount of native copper, together with the carbonates of the same metal. Silver, in the form of argentiferous galena, to the extent of \$31 per ton of ore, assayed; and what is more strange, is the unusual fineness of the gold, it selling readily for \$17.50 per ounce, as it comes from the mine. As to the value of the rock, 15 tons from the deepest shaft was worked at Harris' mill, Sandy Gulch, last summer; it paid \$40 in gold to the ton. I think the opening season will prove this and the Anglo Saxon claim, to be among the best in the district. There are several companies located on the same lead, but the openings on their claims are not extensive enough to judge of their future value. The next prominent claim is called the "Tiger." The location is excellent, having a deep ravine on each end of the claim, either of which will furnish sufficient water for steam and other purposes in connection with a quartz mill. This mine has been extensively worked in former years, by Hewes, Howe & Co. The pay chute in their works was 100 ft. in length, and the ore paid from the surface to a depth of 90 ft., at the average of \$20 per ton. At this depth the vein "pinched" to about three inches, though the walls and casings are perfect, and I have no doubt that further sinking on this part of the mine will develop as large and good a vein as they had in the surface works. The south extension of this lead is called the Smith claim. It has splendid surface prospects, but no work to speak of is done as yet. To the north of these mines is the "Ginn" claim. There has been a large amount of surface work done here, showing rock remarkably rich in gold.

Nevada County.

Transcript, March 21st: At Cottonwood, on the 10th inst., Samuel Clary found a nugget of gold weighing over 14 ounces. The prospects in that vicinity are very flattering. Scott River is quite low, and miners are commencing to work the bars.

Gazette, March 18th: The Banner mill is soon to be supplied with 10 additional stamps. It already has 20 stamps employed, but the number is not sufficient to crush the rock that can be raised from the mine. There are only two mills in Nevada County having 30 stamps each—the number that the Banner will have when the addition is made.

March 19th: S. N. Stranahan, Superintendent of the Chalk Mountain and Blue Gravel Mining Co., informs us that the main tunnel of this company, at the cascades, is now in 350 ft., and the channel was struck some ten days ago. Before the company had been "breasting" half an hour, it took out a two ounce nugget. The gravel prospects well. About half a mile from the above point, the same company has another tunnel in a distance of 120 ft., which has just tapped the channel, from which good prospects are obtained. This company also has a led rock tunnel at the North Fork of Greenhorn, which is in 120 feet, and from indications is but a few feet from the main channel. This channel is a continuation of the one at the Cascades. The company is now working only 10 men, but as soon as the weather will permit, they contemplate employing from forty to fifty.

The Red Diamond Co., immediately he-

low the Chalk Mountain and Blue Gravel Co's claims, at the Cascades, and on the same channel, has been taking out gravel from its tunnel that yields \$1½ to the pan. The tunnel is in 300 ft. Snow at the Cascades is about 6 ft. deep, and a serious impediment to mining operations in that vicinity. The successful opening of this great ancient channel, at the Cascades, will present a new field for gravel mining that has hitherto scarcely been touched. The amount of mineral ground embraced in the channel is incredible. However rich it may be in the precious metal, a thousand men in a century of time, with the benefit of all the appliances that human ingenuity has yet evoked at their command, would scarcely make a visible impression on this vast gravel range, the channel of a once mighty river.

Grass Valley *National*, March 19th: We hear a rumor on the street of the purchase of the Coe mine and mill, near town, by a San Francisco party, who, it is said, intends to commence operations in developing it in a very short time.

John Hearsch, better known as "Lucky John," picked up another specimen yesterday, of the value of \$10 in coin.

The owners of the Idaho extension of the Eureka ledge, have succeeded in striking the ledge in their claims in the 300-ft. drift. The ledge was not cut through, but enough was done on it to prove it to be a large one. The rock shows well in gold, and gives promise of being as valuable as the Eureka. The Idaho Co. own 3,100 ft. The prospecting has been through the hardest of rock, and has cost the company over \$30,000.

Placer County.

Dutch Flat *Enquirer*, March 21st: Messrs. McClure and Wentworth, who have been busily engaged for some time past in fitting up their claim, in Squire's Cañon, commenced washing on Wednesday last. They intend to work steadily throughout the season.

We made notice a few weeks since that Messrs. Baker Bros. had contracted for the building of an astrak, but since its completion it has stormed so hard that it was useless to try to work it; taking advantage, however, of the few days clear weather of this week, they put through a few car loads of their cement, and have had the satisfaction of a clean up of \$8 per car load.

Plumas County.

Quincy National, Feb. 29th: Hallsted & Sparks have stopped crushing rock at their mill in Granite Basin, on account of not being able to get rock from their mine fast enough to keep the mill running. They are still taking out rich rock, intending to start the mill again as soon as they can get a supply on hand sufficient to keep them running.

From Indian Valley we have the following items: The Crescent mill having completed repairs, commenced crushing rock on the morning of the 27th inst. They only started with 16 stamps, but intend running 24 in a few days. They have a large supply of rock on hand, some of which is supposed to be very rich.

The Whitney Co. have discovered some very rich rock in their mine, and have been engaged in crushing it this week.

The Indian Valley mill is running, and is, as usual, doing well.

Judkins & Kellogg's mill at Round Valley, is in full blast.

The Lone Star mill, at Greenville, is expected to commence operations in a few days.

The Caledonia mill has been crushing very rich rock until Thursday morning last, when some of the machinery connected with the pump, used in the mine, broke, which forced the stoppage of the mill. The Superintendent started for Marysville, for repairs. It is supposed the accident will result in the filling of the mine with water, which will cause a temporary suspension of operations in both the Caledonia and Judkins & Kellogg's mines, as they are connected.

The Bull Frog mine, near Rush Creek, has filled up with water, in consequence of the late rains, which causes a temporary suspension of operations.

Siskiyou County.

Yreka Union, March 14th: We understand that Mr. Rushmore, of Indian Creek, who is the agent of a San Francisco company, intends to open and mine the lower portion of Indian Creek. No doubt is entertained but that the lower portion of the creek contains a rich channel of gold. The reason it has not been worked before now, is on account of its depth and the difficulty of draining it.

Yreka Journal, March 13th: Scott River, at Scott Bar, is now quite low, and already permits miners to make preparations for working the bars.

At Cottouwood, on the 10th inst., Sam

Clary found a slug in his claim up Rocky Gulch, weighing nearly 14 ounces, also \$50 besides. The Brass Wire claim is prospecting \$12 to the pan, and rock pitching. The company commenced washing on Tuesday, and confidently expect to take out \$1,600 or \$2,000 in a cut 80 ft. long. All the miners have commenced work, and times will be livelier in the course of a few weeks.

Tuolumne County.

Sonora Democrat, March 21st: A Tuttle-town correspondent writes the following: I visited Mr. Patterson's mine to-day to look at some rock he had just taken out. I saw several tubs of decomposed sulphurets of iron and quartz that was literally filled with gold. Mr. Pearson piloted me down the deep shaft, and from the shaft into the drift, or tunnel, from which the gold is taken. The vein that contains the precious metal is six inches wide, and extends from the top of the tunnel down as far as they have worked. The gold glittering in the rock can be distinctly seen by the light of a candle. This vein can be distinctly traced for the distance of 400 rods, and will average six feet wide.

Yuba County.

Marysville Appeal, March 22d: The Rattlesnake Mining Co., of Brown's Valley, has been incorporated with a capital of \$240,000.

COLORADO.

Central City Register, Feb. 27th: There is considerable activity in bar-mining on South Clear Creek, this winter. At the head of Spanish Bar, Messrs. Bennett & Co. are sinking a shaft to work out the bed of the creek at that place.

Messrs. Schaffer & Clark have just commenced operations on the low bar at the mouth of Chicago Creek. We saw two sacks full of bed-rock dirt rocked out a few days since by Mr. Holverson, which yielded over two dwts. of coarse gold. He took the dirt from a shaft a few rods from Clear Creek, on Chicago Creek. One or two other parties are "coyoting" in the same vicinity, and making fair wages. Four or five parties are "drifting" between Idaho and Spanish Bar, and all say they are making more than grub.

Several parties are prospecting the creeks and bars below Idaho, and they get, generally, quite encouraging prospects. Gus. Reeder brought up three ounces of gold on Saturday night, the result of two days' sluicing (five or six hours per day) by himself and partner.

Mr. Theo. Lowe has commenced rebuilding his dam, with a view to starting up his mill as soon as possible.

Messrs. Schwartz & Mixer have recently struck a new lode in Virginia Cañon which promises to be a valuable one.

Work on the Bobtail has been stopped on account of the insufficiency of the pumps.

A piece of gold bullion weighing 272 ounces, and worth \$6,200 was to be seen yesterday at Warren Hussey's. It is the result of the last run made by E. C. Beach.

The owners of the Aurora lode inform us that Mr. Peregrine crushed for them last week, one and three-fourths cords of ore from their mine, which yielded 36 ounces and 9 dwts. of gold, worth in currency \$785. If they estimate their labors at \$5 per day, it will still leave a net profit, after all costs are paid, of \$410.

Charles Walker is building a new 18-stamp mill below Black Hawk.

We were shown yesterday samples of ore from the Munsell lode. It has four feet of crevice matter, six inches of which yields an average assay of \$2,100.

We saw yesterday, \$800 in gold bullion from one and three-fourths cords of ore from the Aurora lode.

Same, March 5th: John Wagner and others are erecting a shaft house on the Cash lode, in the upper end of Virginia Cañon. They are down 50 ft. showing an excellent body of ore which yields an average of \$195 per ton.

Mining was not stopped on the Bobtail as agreed upon. As they were about to shut down it was discovered that the pumps were rapidly mastering the water, so it was determined to go on. It appears that the Bobtail, Gregory, Fisk, and some other lodes are so associated that the water runs from one to another, and when one is troubled with water the others will be also.

Georgetown Miner, Feb. 27th: The ore now being raised from the Baker mine, shows by assay from \$200 to \$500 silver per ton.

The finest specimen of silver ever subjected to our inspection, was shown us on Tuesday by Mr. Crow. It was a hlock of galena weighing some six or eight pounds, taken from the Terrible lode. The galena was completely impregnated with stephanite, the fine cubes of the galena in many

places being cemented together with this rich substance.

Garrott, Martine & Co., have started up their reduction works.

Mr. Herrick will soon commence purchasing galena ores for the Georgetown smelting works.

There is more mining being done on Brown Mountain and vicinity, at present, than in any other portion of the country.

Denver News, March 4th: We saw at the mint this morning a bar of gold bullion weighing 33 4-100 ounces, and valued at \$540.42 in coin; also four bars of gold bullion valued at \$1,722.93. There are a number of other bars not yet assayed.

DACOTAH.

The second number of the *Sweetwater Mines*, gives the following items in relation to the mines: A 10-ft. shaft on the Maggio Evans lode displays a vein of ore 10 ft. 6 in. in width. The Kentucky Home lode, at a depth of 30 ft., shows seven ft. of ore. The Walrus lode has a vein over 10 ft. wide. On the Atlantic, a tunnel has been run, striking the vein 40 ft. below the surface, and showing a vein 22 ft. in width. The Miners' Delight lode, yields at the rate of 20 ozs. of gold to 900 lbs. of ore. New placers have been discovered on Slate Creek. On Rock Creek there are 196 claims.

From a private letter written by J. W. Meniffee, dated Rock Creek, D. T., Feb. 22d, 1868, we extract the following: I receive many letters of inquiry to know my views of this country. We don't find or pick up gold by the hushel or peck, neither by the hundreds nor twenties. Placer diggings are limited, and what there are I don't think are as rich as some men feel disposed to represent them. I have discovered and own among the best of them in this section, and I would give any one to-day their choice in them for \$1,000. Ounce diggings, I think, will be the best we will have in this section. That sum is as much as any of them will pay, and the number of claims producing that amount to the hand will be very limited indeed. I anticipate making about a half ounce to the man daily in my claims here in Rock Creek, but I don't think it will pay all through the creek that well, for it will be very hard to work the most of it. The creek has been located and recorded for a distance of ten miles, and if should pay the full length it will make a lively camp around here; but if Rock Creek fails I think the camp about played out as to placer diggings. There has been a big stampede in the last 10 days to Wind River for placer mines, where they can pick up the nuggets on top of the ground—(an Indian story.) The facts about it will not be known for a month yet, for it is over 100 miles from here. The generality of miners here are but poor judges of quartz, and a man only familiar with silver hearing quartz is a poor judge of auriferous rock. Any man can tell when he sees the gold in the rock, but it is hard to tell what it will pay by mill process. There are many fine ledges here already discovered, and many more to be found, but the most of them are quartz—not gold. I think if they average from \$25 to \$50 per ton they will do extraordinary. Many that have been located will pay nothing.

IDAHO.

Boise World, Feb. 29th: During the eight months preceding Jan. 1st, of this year, Messrs. Koenigshberger and Heckman of this city, and Mr. Burkitt of Pioneer City, assayed over \$1,250,000 of gold and silver. It was the product of this basin.

Our miners are preparing to resume work in every portion of our mining districts. The ditches are being made ready to convey water, and the owners of bar, gulch and hill claims are busily at work clearing away obstructions. None of our mining population talk of going off in quest of other diggings—to Willow Creek, Sweetwater or elsewhere.

Same, March 4th: On Monday morning work was begun for the season in a number of claims in this vicinity—in Dnnn's claim on Bonum Hill, on claims up More's Creek, and along Elk Creek.

Same March 7th: The miners are preparing their claims all about the Basin, and many are already at work. Things begin to look bright in trade generally.

From Mr. C. Lee, who lately made the journey from this city to Rocky Bar and back, we derive the following items:

Men are actively engaged in McNulley's Wide West, Jackson & Co's Golden Star, and the Confederate Star ledges, and very rich ores have been taken from each of these ledges, which are ready for crushing. It is estimated that from \$60 to over \$100 per ton will be the product of these ores.

Preparations are going on to bring in Col. O'Neil's fine large mill, which will quite surely be in operation this season.

Lee Motherhead is on the way from the

East with a large mill for the Yuha Atlanta ledge. Duffries is also coming from the East with a mill for the Volcano mines at Canas Prairie; and Maj. Taylor and Wm. S. Stevens will soon have a splendid mill for their Grey Eagle ledge in Yuha, which they procured in San Francisco.

A very prosperous mining season, in quartz, is looked for by all in Rocky Bar, and Altums generally, and preparations for a wider field of placer mining have been made already this season.

There was about two ft. of snow at Rocky Bar when Mr. Lee left there, Feb. 28th, but this did not prevent work in the mines.

Owyhee *Avalanche*, March 7th: The Pickens & Edwards is the name of a ledge newly discovered at Cottonwood, midway between this place and Flint. The vein is said to be somewhat over 18 inches in width. Some pieces of the rock shown us, bear evidence of being very rich in silver.

Work has commenced in good earnest on the north extension of the Allison mine. The shaft is now down 84 ft., which shows a vein four ft. between the casings. The quartz is of a soft decomposed nature, easily taken out and does not require blasting.

There is enough ore from the Ida Elmoro mine on band at the Lincoln mill to keep it running five or six weeks.

Portland *Oregonian*, Feb. 25th: A private letter from Warren's Diggings states that the rock from the Hie Jacet mine, recently crushed, yielded \$300 per ton. The camp is in a state of jubilation over the result, and other companies are pushing forward their work with great confidence.

NEVADA.

Esmeralda.

Virginia *Enterprise*, March 19th: Pine Grove is one of our most promising outside districts, and will be apt to receive very considerable accessions to its mining population during the coming summer from this vicinity. All the principal mines are yielding well in gold bullion and many new and promising leads are being opened. We were yesterday shown some very fine specimens of gold bearing quartz from leads that have not as yet made a noise in the world. The Wilson, Wheeler and other well known leads, still continue to yield large amounts of rich ore; all the miners in this district are employed either at work in mines of their own or in the mills and mines of others, and the camp is, all things considered, one of the most prosperous in the State.

Reese River.

Reville, March 7th: We saw yesterday several of the most elegant silver bars ever produced in the city. They were made of silver obtained from ore chloridized in the new furnace patented by C. A. Stetefeldt, and were skillfully finished and engraved by Z. Veuve of this city. The bars are intended for souvenirs by the inventor of the furnace.

March 9th: The stage which will depart to-morrow for Belmont will carry a lot of castings for the mill of the Combination Co. They were executed at the Austin Foundry.

By the stage which arrived from Belmont on Saturday night three bars of bullion arrived from the Combination Co.

There may be seen at the office of the Austin and Belmont Co., a choice lot of samples of ore from the Silver Bend district. They were obtained from the Belmont Co's claim on the Transylvania, and W. F. Leon & Co's claim on the El Dorado, two of the great ledges in the district. We learn that the samples were selected from the mines by Prof. Vincent, who came from London with Col. Buel for the avowed purpose of examining certain claims in the district of Silver Bend and perhaps in other districts in this part of the State. The samples are large and fine, but they are no better than those which were embraced in the collection sent to the Paris Exposition.

Our attention was called this morning in the assay office of David Landbom to a small but very valuable bar of bullion. It was produced from ore taken out of the Gilligan mine of the Social and Steptoe Co. in Egan Cañon. It weighs 517 ozs.; is .41 fine in gold and .895 fine in silver, and has the stamped value of \$1,036. The bullion formerly averaged only about 10 fine in gold, in the same process of reduction. The ore which produced this last bullion was obtained from the deepest working of the mine.

March 13th: It is known that the mill of the Belmont Co. has been closed for several weeks, in consequence of the fact becoming patent that they were not saving 30 per cent. of the silver contained in the ore produced by the Transylvania mine by the process of amalgamation without roasting. The superintendent closed the mill until it could be furnished with roasting furnaces. The slight amount of silver obtained in the mill of the company has been clearly shown by

Prof. Vincent, who gave the tailings a critical examination. He selected and assayed numerous samples from the heap, which gave an average yield of \$52 per ton. The accumulation of these tailings is so great that it is estimated they contain upwards of \$100,000 worth of silver. We learn that the few weeks' experience of the 40-stamp mill of the Combination Co. has led to the same result; and they were engaged in adapting the whole battery—20 stamps of which were adapted to crushing the ore wet—to crushing the ore dry.

The Keystone mill, which has been lying idle for several months, will be set in motion again on Monday next. It has been put in perfect condition, especially in the amalgamating department, which is furnished with new pans.

The production of bullion from the Florida mine during the month of February was very handsome. Eighty-one tons of ore were sent to the California mill for reduction, which yielded \$21,007 in gold coin. The ore, which represented the mass of the vein, averaged \$259.34 in coin per ton.

March 16th: On Saturday afternoon the Belmont stage brought to the banking house of John A. Paxton & Co., five bars of bullion from the mill of the Combination Co.

The California mill of J. R. Murphy, has been closed for the present.

A new district, called Robinson district, has been discovered about 100 miles southwest of Egan. Sixteen lodes of astonishing size—the smallest 16 ft. wide and the largest 150 ft. wide have been discovered. All of the lodes can be traced for hundreds of feet, and the rock is certainly none of the poorest. The country rock in which the veins are imbedded is granite.

Silver Bend *Reporter*, March 7th: Antonio Borques has purchased from the Red Mountain and Silver Peak Co. the 4-stamp mill formerly used in crushing the gold bearing rock of Red Mountain, which will be removed and reerected at this place as soon as the roads and weather will permit.

During the month of February there was shipped from Austin, bullion valued at \$151,635.33.

A correspondent of the Virginia *Enterprise* of March 18th, writes: I mentioned in the *Enterprise* some time ago that a series of mines in Morey district had been sold to Mr. David S. Ogden, of New York, for \$32,000 in coin. The Magnolia lode of the series, on which considerable work has been done recently, has improved greatly in appearance. At the depth of 85 ft. the vein shows two ft. of pay ore, and the drillings from a 2-ft. hole gave an assay of \$1,020. By numerous working tests at the mill of the Old Dominion Co., at Hot Creek, the ore was proved to range from \$90 to \$250 per ton, there being apparently considerable surface rock at command which will pay \$120 to \$150 per ton.

The Fortuna mine, on Lander Hill, is yielding very fine ore. A hatch just worked at the Manhattan mill gave a pulp assay of \$820 per ton.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Enterprise, March 14th: Wells, Fargo & Co. shipped from their office in this city, during the past week, 2,943 ounces of assayed bullion, valued at \$71,087.38.

March 18th: Work was yesterday resumed on the Segregated Belchor mine, after lying idle some seven months. It is thought that paying ore will at once be taken out. Mr. McCullough, Superintendent of the Overman, will have charge of the work.

March 19th: Two new boilers have been put into the Petaluma mill—also a lot of new amalgamating pans—and, with everything in "ship shape," the works have again started up. The mill is capable of crushing 50 tons of ore per day.

Judging from present talk and indications, all the prominent leads on Cedar Hill will be worked during the coming summer, and even a few leads that are hardly known by name. We saw some ore a day or two since from a nameless lead on the hill, that showed by assay the handsome sum of \$36 per ton. It is well known that the Sacramento mine contains a vast amount of pay ore—gold bearing quartz—and parties have been at work in the mine all winter, or whenever the weather would permit. By working the ores of the hill for gold alone—they contain but little silver—there can be no doubt but they can be made to pay well, as a large amount per stamp can be crushed daily; then the trouble and expense of amalgamating in pans will be dispensed with, only copper plates and sluices being used to save the gold. That there is an exceedingly rich chimney in the hill that

has never yet been found, no miner at all acquainted with its history can doubt. The dirt on all its slopes is rich in gold, and on the southern slope, near the old works of the Sierra Nevada Co., a party of miners a few years since made big wages at washing the dirt with a hydraulic apparatus. They also sold the rock (which was nearly all quartz forked from their sluices) to the mills for a good price. While thus working they found many pieces of quartz that were literally covered with gold. We saw one piece found in the claim that after being broken could not be separated on account of the wires of gold running through it. The chimney from which this rich dirt and rock came has never yet been found, but is undoubtedly somewhere above the old hydraulic works. That the hill is rich in gold no miner can doubt, and we shall yet see many mills running on Cedar Hill ore. We are satisfied that some valuable discoveries will be made in that vicinity before next fall.

Trespass, March 14th: Dispatched from Wells, Fargo & Co's office in Virginia, this morning, 15 bars of bullion, weighing 974 pounds, and worth \$42,611.04.

OREGON.

Jacksonville *Sentinel*, March 7th: We are informed that the claims of McDaniel & Therman, at Sterlingville, is averaging \$20 per day to the band, without any prospect of giving out as yet.

The claim of Johnson & Co. is paying an ounce per day to the hand. Messrs. Kleinhammer and Mentz are taking out good pay—about \$10 per day to each man, and the well known claim of Saltmarsh & Co. is panning out as usual.

Dalles *Mountaineer*, March 7th: The Canyon City correspondent writes: The miners are preparing for work along Cañon Creek. They are clearing away rubbish, repairing pumps, wheels and derricks. At Marysville and vicinity there will be several new hydraulics put up this spring. Thompson & Co. will put up two. They have one on their claim ready for work as soon as the frost is out of the ground, and another built which will be put up in a short time. Clark & Co. will run two on Windlass and Rich Gulches this season; and on the hill west of Cañon Creek, Beasley, Bollinger & Co. are building a fine large hydraulic. Wolfinger, Long & Co. will run their Town Gulch hydraulic as soon as water comes.

Salem *Unionist*, March 10th: Mr. Salmon, Supt. of the quartz mill in the Santiam mines, arrived yesterday, direct from the diggings, where he has been all winter. The snow is four ft. deep on the summit. Mr. Salmon traveled on snow shoes until he reached the lower spurs of the mountains. He brought a gold brick weighing 32 ozs., taken from quartz quarried from the White Bull lead. He is sanguine that he can make the mines pay, and designs returning as soon as the snow goes off.

Portland *Oregonian*, March 12th: The Cañon City correspondent gives the following information: The mines in this vicinity are numerous. Several very rich quartz ledges have been partially developed, among which is the famous I. X. L. ledge, known as one of the richest in Eastern Oregon. The owners of this ledge are engaged on a tunnel some 600 ft. in length, which will be finished in a short time.

On the north side of John Day river is Dixie Creek, a camp of some importance, which employs about 200 miners, mostly Chinese.

North of Cañon City, on the Middle Fork of John Day river, is Elk Creek, running in from the north, which is considered by competent judges as the best quartz mining district in this State. The ledges are mostly lying idle for want of capital to work them successfully. There are about 60 persons at this place. Twelve miles above on the same stream is Vincent Creek, with but few mines. North of Vincent Creek about 15 miles are Olive Creek and the Burnt River diggings, and six miles north of Olive is Granite Creek. These camps are the most important points in that section. About 250 miners, half of whom are Chinese, find employment there.

Sixty miles north of Cañon City is the North Fork of John Day, where there has been some excitement over the discoveries of the past season. But the truth is that few claims have been found which justify working, and the place is declining.

NEW MEXICO.

Santa Fe *Gazette*, Feb. 29th: Governor Mitchell who arrived from the Morano mines on Thursday of last week, reports most favorably of the mining prospects for that region during the coming season.

There are now in and about the mines between 2,000 and 3,000 persons waiting for the opening of spring weather

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, . . . \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Suedt.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. C. Pelton.*

After an careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. H. Hill.*

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—*F. W. Bach.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Denman.*

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—*Caroline L. Atwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, A. M.*

I believe the work will be a valuable and much needed addition to our school text books.—*Herman Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*I. H. Bragdon.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and advocates at the forum.—*John Curry.*

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * * Exactly calculated to interest. It will soon become a necessity in every lawyer's library.—*Charles A. Tuley.*

Its clearness and comprehensiveness make it easy.—*G. W. Bente.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to touch the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which so much can be obtained in such a concise exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—*S. P. Bulletin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and style cheap and convenient, and in reach of the humblest.—*Alta California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. P. Times.*

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken), holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—*S. P. Examiner.*

This is an age in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stockton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Marysville Appeal.*

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Mr. C. T. Raney is our duly authorized agent for Sacramento County. Nov. 23, 1867.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

San Francisco:

Saturday Morning, March 28th 1868.

Notices to Correspondents.

CURIOS.—Tellurium has sometimes been found in the native form, containing, however, small quantities of iron and gold. It is also found as tellurous acid, telluride of bismuth, telluride of lead, etc. We are not aware of any instance in which any of the metallic compounds of tellurium found native has ever yet been discovered that were entirely devoid of the precious metals; the lead compound being usually found the most free. Berthier analyzed an ore of this character, which he found to consist of tellurium 13.0, sulphur 11.7, lead 63.1, gold 6.7, antimony 4.5, copper 1.0—100. The atomic weight of tellurium is 64. It is usually classed among the metals as possessing properties between antimony and bismuth. In the metallic form, its sp. gr. is 6.2, is of a tin white color, with a strong metallic luster, very brittle and easily pulverized. When obtained in a finely divided state by precipitation or sublimation, it forms a brown powder.

JUVENILE.—is informed that a geological map is simply a topographical map, colored in such a manner that certain colors indicate the geological character of the surface or outcropping strata, in the various parts of the country so mapped. Metallic veins are noted by lines, and the species by employing symbols for the various metals; the symbols used generally being the old alchemical ones, such as you see on the bulky bottles commonly placed in the windows of druggists shops. These symbols also possess a mythological meaning; thus the one for lead also means Saturn; for copper, Venus; for tin, Jupiter; for silver, Luna or the Moon; for iron, Mars; etc. The direction of dips are represented by arrows, by which means synclinal and anticlinal axes are also denoted.

A YOUNG ASSAYER, Silver City.—The color of gold will occasionally vary, in consequence of either the flux employed in melting or the mode of refining. The proper color for pure gold, is a beautiful bright yellow, inclining very slightly towards red. When horax has been employed in any considerable quantity as a flux, its color is somewhat paler; but it again assumes its ordinary shade on being again melted along with nitre or common salt. When reduced to very thin leaves, it is transparent, and by the transmitted light appears of a yellow color. Vauquelin suggested that its true color under such circumstances, is blue, and that the green appearance is caused by the admixture of yellow rays of reflected light. M. Buisson, considers that gold in an extremely minute state of division, assumes a purple color.

THE FIFTH WHEEL.—The central wheel, running in a groove, and attached to French street cars, of which we have spoken, and which finds great favor in Paris, was invented by an American named J. B. Wickersham.

JAPANESE TEA SEED.—Some of this seed has been received in this city. Those who have made the experiment, say there is no difficulty in cultivating the plant here. It is said to belong to the order Camelia, is perennial, and is a handsome shrub.

The Suez Canal.

Much misapprehension appears to exist with regard to the present condition and progress upon this public work. It was recently stated at a meeting of the Mechanical Engineers' Society of Birmingham, that out of the 70,000,000 cubic yards of excavation involved in this work, only 18,000,000 had thus far been removed. This statement was subsequently officially corrected, in a statement by one of the Canal Directors, from which it appears that on the first day of December last, 30,000,000 yards, out of the 70,000,000 called for had been removed—nearly one-half. At that time, 1,350,000 yards were being removed monthly, by the aid of thirty-nine dredging machines and 10,000 laborers; but twenty-one additional machines were being fitted up, which, with their additional complement of laborers, would soon be at work; and under such increased facilities it was confidently anticipated that the entire work would be completed prior to the contract term, October 1st, 1869. The terms of the contract call for a penalty of \$25,000 for every month's delay, beyond that time, and allow \$25,000 additional payment for every month of time gained. The contractor, M. Lesseps, expects to realize something from this contingent arrangement. The capital of the company is said to be largely in excess of the amount required for the completion of the work—nearly a million dollars of surplus has been counted upon. It also has a large concession of land adjoining the canal, which, with the near approach of its completion is rapidly appreciating in value—especially that lying in the vicinity of Port Said. It is thought that when the work is completed this land will be worth nearly if not the full cost of the work—leaving, by its sale, the canal nearly or quite free of cost to its projectors.

Many have supposed that because some smaller vessels have actually passed through, from the Mediterranean to the Red Sea, the canal was completed; but such is far from being the case. The work appears to be carried on by snail-paced excavators, much after the manner of dredging docks; and as the work is in progress along the entire line, it is even now available for light draught vessels. It will be recollected that the English government recently sent a small steamer through the canal, to be employed in the Abyssinian expedition against King Theodore.

If this work is successfully completed, and the two ports or entrances made secure, it will be the most important and useful engineering work ever accomplished by man. It is significant of English policy to note the action of that government as the work proceeds. The moment the English perceived that the French were in earnest in the matter of its construction, that government seized the little island of Perim, which is so situated that it may easily be made the Gibraltar of the Red Sea, as by its proper fortification no ship can enter or leave that sea except by permission of the holders of this island. Later, when it became apparent that Port Said could and would be made a safe refuge for a French fleet, the English secured to themselves the occupation of the harbor of Suez for a similar purpose. Finally, when the successful completion of the canal had become a foregone conclusion, the Abyssinian expedition was decided upon. England is determined not to allow the French any vantage ground in the Red Sea; their joint occupation will hold it free to the commerce of the world, and afford an additional guarantee that those great nations shall forever preserve peace between themselves.

SORGHUM SYRUP.—It is a fact, we imagine, of which but few are aware, that over 40,000,000 gallons of sorghum syrup are made in this country annually.

Maple Sugar.

Few, we imagine, are aware of the large amount of maple sugar and syrup which is annually produced in this country. As long ago as 1860, the census reported a fraction over 20,000 tons of sugar, and upwards of one and a half million gallons of syrup, as the product of a single year. Doubtless much more was manufactured, of which the census takers got no account. If we estimate the syrup at \$1 a gallon, and the sugar at fifteen cents per pound, we have the snug little sum of nearly \$8,000,000, as the total annual value of this delectable sweet. New York takes the lead in this production, giving us over one-quarter of the entire amount; next comes Vermont, with but a small fraction short of one-quarter; Michigan comes next with 2,000 tons. Twenty-nine States appear in the census report as producers in this line. The census of 1870 will undoubtedly show a large and rapid increase of maple sugar products during the present decade.

It will doubtless surprise many of our readers that a majority of the Southern States figure in the census as producers of maple sugar, viz.: Alabama, Arkansas, Georgia, Kentucky, Missouri, North and South Carolina, Tennessee and Virginia—the last named producing nearly 500 tons. We have often been impressed with the idea that California is especially adapted to this culture. There are a few of these trees found here, natives of the soil, and a few gallons of syrup are reported in the census of 1860, as having been made here, but no sugar. There would seem to be but little question that the same genial climate which so materially increases the production of saccharine matter in the sugar beet, would perform the like favorable office for the sugar tree. The sugar maple is a beautiful shade tree, and might be made to grow most luxuriantly along all our water courses, and in every mountain gulch in the State. A nook or a corner here and there would grow a dozen or more of these trees, and a side hill in a glen or gorge, that is fit for nothing else, might be covered with them. Millions might thus be grown to the great benefit of all and the injury of none. A few trees will supply a family with many pounds of this most delicious sugar. Will not some one who may be acquainted with the culture and habits of this tree furnish some facts with regard to it, and inform the public through the Press, whether or not we are correct in our surmise as to its possible culture in this State.

THE EARTHQUAKE.—The shock of earthquake on Tuesday last was of moderate violence. The oscillations were from northeast to southwest, and continued six or eight seconds. The County Court adjourned for five minutes—rather hastily,—for the City Hall is not considered particularly safe on such occasions. Quite a panic occurred at one of the public schools; a rush was made for the door, and the pupils became wedged therein for a time;—some being trampled upon, and more or less injured. No buildings, so far as we have heard, were damaged.

KUSTEL'S NEW WORK on the concentration of ores is meeting with rapid sale. In addition to the regular sales at the book stores, we are daily receiving orders for the book to be sent by mail to all parts of the Pacific Coast. We shall take an early opportunity to give, in a condensed form, the numerous commendatory notices of the work which have appeared in the various papers of this city and throughout the mining regions. The book is sent from this office by mail, postpaid, to all parts of the Union on the receipt of \$7.50 in coin, or its equivalent in legal tenders.

If your eyesight is beginning to fail, try Muller's spectacles. No. 205 Montgomery street, Russ House Block.

NEEDLE-WOMEN'S COÖPERATIVE UNION.

A mass meeting of those interested in this movement was held at Union Hall on the evening of the 23d inst. Mayor McCoppin called the meeting to order. Judge Hamilton read an eloquent address, in the course of which the object of the scheme was set forth. Rev. Mr. Stebbins made an excellent speech. He was followed by Rev. Dr. Scudder and R. B. Swain, Esq.

Mr. Stebbins described the proposed plan of procedure. Three thousand shares at \$10 each, are to be issued, and will draw interest at one per cent. per month. The money thus obtained will be put into the business. Sewing-women will be furnished with material, and their work when completed will be purchased at a fair schedule price by the Association. Ten per cent. of this price will be retained, and placed to the credit of the women for stock account. In this way, the stock will all ultimately come into the hands of the working-women themselves; so that, while getting a fair price for their labor, they are also getting interest on their money.

We look upon this movement as one which will in the future constitute the chief glory of San Francisco. To be the first to move, in an earnest and systematic manner, for the permanent relief of the down-trodden and suffering class aforesaid, is something that any city in enlightened Christendom may well be proud of. The movement is, too, as politic and far-seeing as it is humane and Heaven-prompted. It is not merely that it will brighten faces now sad, and gladden hearts now desponding;—that it will change many a miserable garret and cellar into a cheerful home, which the light of hope will warm like life-giving sunshine; but its results will appear in the more distant future,—will be as lasting as the city itself. It will bring to us from the Atlantic States many a worthy young woman who will save from destruction some one of the many young men among us, who are now fast "going to the bad" solely for the lack of a good wife; and generations to come will show the difference between the offspring of happy mothers, who have time and means for self-culture and improvement, and that of ill-fed and care-worn women, in whom hope is crushed, and the only thought is for the morrow's daily bread. We bid the movement "God-speed!"

THE STATE GEOLOGICAL SURVEY.—The Senate has finally followed the example of the House, and passed the Appropriation Bill, without specifying any sum for the continuance of the Geological Survey. This is equivalent to the putting a stop to the work. This action will do the State no good abroad. It is hardly worthy of a Commonwealth like this, after putting its hand to this great and admittedly important work, to stop short of its completion. The sum of \$15,400 was appropriated for liquidating the existing deficiencies in the office—nothing more. But whatever may be thought of this, there can be no excuse for thus dropping it, without making provision for a proper closing up of matters connected with it,—for the meeting of the obligations already incurred for still uncompleted printing and engraving of volumes and maps,—and for the storing and preservation of the collections, etc., already on hand. It is not easy to comprehend the action of the Legislature in this matter, unless upon the supposition that it is in contemplation to pass a special bill for meeting their obligations. We hope that this will be done; and, we may add, we still hope that if it is done, better counsels will prevail, and that the Survey will, after all, be continued. If there is a State in the Union where such a Survey is especially desirable, it is California.

NOTEWORTHY.—Freight cars, loaded in Boston, have gone through to Cheyenne, the present western terminal point on the Pacific Railroad, a distance of over 2,000 miles, without breaking bulk by the way.

PURE CALIFORNIA WINES.—The civilized world is gradually waking up to the realization of the fact, that the soil and climate of our coast are most admirably adapted to the culture of the grape and the manufacture of wine. Mr. B. D. Wilson, the pioneer wine grower of the Pacific, and proprietor of the large and celebrated Lake Vineyard Ranch, Los Angeles County, has established a depot at No. 425 Jackson street, in this city, for the sale of his already well-known brands of Port, Sherry, Angelica, Mound Vineyard, Lake Vineyard white wines, and grape brandy, together with the best assortment of the choicest varieties of pure wines from other parts of the State. As the business here is conducted by the Messrs. J. De Barth Shorb and Carlton Curtis, gentlemen of intelligence and the strictest integrity,—the former a son-in-law of the proprietor,—the public have the fullest assurance that no impure or adulterated article will be offered; but on the contrary, they will have the pleasure of examining only the best and purest wines from Mr. Wilson's vintage, or well-selected brands from other portions of the coast. In addition to this, we understand that Mr. Wilson, before embarking in the business of wine making, had already amassed a considerable fortune which afforded him facilities for its successful prosecution, enjoyed by few. This enabled him to secure a choice locality with favorable conditions as to soil and climate, pipes, cellars, commodious receptacles and all necessary appendages, and to command for his enterprise the most skilled labor and the best intellect of Europe and America. He has consequently always taken, we believe, premiums at our State Fairs, when properly represented. He has successfully produced nearly all classes from the Hock of the Rhine to the heavier wines of Spain,—his white wine being pronounced by connoisseurs as the host on the coast. Among this latter class is his far-famed Mound Vineyard, produced only from one vineyard, from which it derives its name. It is exceedingly mild and palatable, and possesses, without doubt, a more delicious bouquet than any other California wine. His Angelica and Port wines are so well known and appreciated, that it would be useless to refer to them here. The following beautiful, (but necessarily curtailed) description of the ranch and its surroundings, is from the correspondence of the *Evening Bulletin*, of the 28th ult:

A delightful drive from Los Angeles of some eight miles, and the tourist alights at Lake Vineyard, owned by Mr. B. D. Wilson, and pronounced the most lovely spot in California. In all there is some 14,000 acres of land, 1,000 of which are devoted to vineyard and orchard. Mr. Wilson is one of the most extensive manufacturers of wine and brandy upon the Pacific Coast. He has 350,000 grape vines, 2,500 orange, 500 lemon, 100 lime, 400 olive, 1,000 walnut trees, and nearly 1,000 trees of the other varieties of fruits. Lake Vineyard has been visited by ladies and gentlemen from all sections of the globe, all of whom are lavish in their tender of praise. It is indeed an enchanting spot, and combines more of beauty and attractiveness in its locality and picturesque sublimity, than any place I have ever visited. Standing at the door of Mr. Wilson's residence, the eye wanders over a panorama of beauty; little rivulets of sparkling, gurgling water discourse exquisite music; while the air is fragrant with millions of flowers and musical with unnumbered voices of feathered songsters. I realize in all its grandeur and gorgeousness the vision of the fabled Rossas, presenting all the blooming freshness and beauty of flowers that adorn the bosom of a young bride.

PASSED BOTH HOUSES.—The telegraph of last evening announced that the Mechanics' Lien Law, had passed both Houses of the Legislature. Of course it will receive the signature of the Governor and become a law.

It is said that the famous Napoleon gun, about which so much was said last fall, is nothing more nor less than the Gatling gun—an American invention.

BET ROOT SUGAR.—The *New York Times* is authority for saying that fully one-third of the total amount of sugar consumed in the world is manufactured from beets. At the present time, immense quantities of raw beet sugars are imported into England for their refineries; and it is said that the foreign beet sugar is competing very successfully with the cane sugar produced in the English colonies. The moist atmosphere of England, and lack of sunshine, precludes the successful cultivation of the beet there.

The above facts are highly encouraging to Californians, as showing that the culture and manufacture of beet sugar is an accomplished fact in Europe, where the climate is far less suited to it than here. The sugar beet finds its most congenial home in California. Under the influence of our dry atmosphere and continued sunshine, the beet secretes fully two per cent. more saccharine matter than does the same plant in Europe. We hope to see the time soon arrive when every pound of the 12,000 tons of raw sugar now annually imported for our refineries shall be produced on California soil by California producers.

THE STEAM MAN.—Some of our contemporaries have expressed doubts as to the actual construction of the machine, which has been described as the "Steam Man." In order to remove such doubts, the proprietors have caused photographs to be taken, one of which was received per last steamer by A. S. Hallidie, President of the Mechanic's Institute, of this city. The same has been placed in the hands of a photographer of this city, by whom copies will be taken and offered for sale the coming week.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1863, furthest advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY. and 7—SELECT COURSES.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v16-1y16p

Number of Policies issued in 1867, 10,300.

Amount Insured, - - \$31,375,671 00.

POLICIES ISSUED AT ONCE,

On receipt of Application at the San Francisco Branch Office, without referring to the Home Office at New York.

Policies Paid in Gold Coin or Greenbacks, at the option of the person insuring.

[Extract from report of the Home Office, for Dec. 1867.]
"The Company's history for the past fifteen years shows favorably, and it standing to-day ranks it among first class Societies. It has carried out in good faith every contract made by it, never contesting a Southern claim during the war, while it is well known that many of our largest companies repudiated their Southern risks at the commencement of our National struggle, thereby increasing their assets. This honorable dealing of the Knickerbocker in the past, is a pledge of its future good faith."

EUROPEAN RAILROAD ACCOMMODATIONS.
Hon. Louis W. Hall, now traveling in Eu-
rope, writes thus from Nice, Jan. 8th: "The
general railroad accommodations in France
and England are not near so good as in the
United States, but in speed and safety, their
best railroads excel ours, with a very few
exceptions. The precautions exacted and
enforced here for the safety of travelers we
do not have in the United States, and I pre-
sume the entire freedom of the people would
not submit to, even though enforced in the
shape of rules to protect limb and life. I
know of no other points of excellence.
Their cars are not as good as ours, nor are
they provided with any of the modern im-
provements. As an illustration, we were
all night in the cars on the ride to Marseilles.
When we left Paris there was snow on the
ground, the weather was exceedingly cold
and freezing hard, and yet there was neither
stoves in the cars, nor heat of any kind,
except that several times on the long ride
of sixteen hours, copper boxes of hot water
were thrust into the coupe to keep the feet
warm. These got cold in about an hour,
and are then in the way and a nuisance, till
the next ones are put in, which is not done
very frequently."

THE DARWINIAN THEORY.—Rev. F. A.
Ewer, of New York, recently delivered a
lecture upon this subject, before the General
Society of Mechanics and Tradesmen. We
quote briefly from the lecture as reported
in the Tribune: Divines may object that
Darwin's theory is atheistic because it de-
nies the intervention of a Creator in the ex-
istence of all these varieties of life, but
does it? Does it not suggest a higher idea
of a Creator who is eternally working
through that operation of his laws, in pro-
ducing constantly new forms of life, than if
we regard him as one who, having at one
period long ago laid, expended all his
power in one spasmodic act of creation, and
then retired to rest, and contemplate through
all future time the working of the machine
which he has set in motion?

COAL OIL THEORIES ALL "SHAKY."—
The production of coal oil is increasing
even in this cold weather, and is now over
eleven thousand barrels daily. The pro-
duction, kept up, would give over four mil-
lions of barrels yearly. Now that oil is so
cheap, up comes a flowing well, pouring
out its three hundred and fifty barrels, over
by the once-to-have-been famous Reno,
marking out a new course or belt for oil veins;
and another, twelve miles from it, near the
Shamblour district, has been for three
weeks flowing quite as much, destroying all
the later theories about flowing wells, for
these wells are cased, and it had been dem-
onstrated beyond dispute that wells cased
could not flow. So it goes, and the latest
theory is always overthrown by the first
frost.—Pittsburg Chronicle, Jan. 30th.

WALKING VEHICLE.—At the meeting of
the Farmers' Club of the American Insti-
tute, a "walking vehicle," patented Feb. 4,
1868, by R. C. Vernol, of New York City,
was exhibited in model, which was operated
by clock work, although steam is intended
to operate full-sized machines. The rear
portion of the machine is supported on four
legs, two on each side, which are connected
with eccentric shafts in such a manner as
to receive an up-and-down as well as oscil-
lating motion, and when put in operation
perform the same function as the legs of an
animal. A hand-wheel placed in front
guides the forward wheel and directs the
course of the machine. It is intended as a
substitute for the traction engine, and will
ascend quite steep grades.

AN ENGLISH WRITER.—An English law-
yer has forsaken the gown and bar to in-
vent and perfect a flying machine. He pro-
poses "to convey passengers through the
air by a steam bird, or a flying steam en-
gine fitted with wings flapped by the action
of steam." A patent has been taken out
for this contrivance, but the machine is not
yet ready to be put in operation.

ALUMINUM ALLOY.—A new alloy of alu-
minum has been made known by M. M.
Paul, Morin, and Ruolz. It consists of
one-third silver and two-thirds aluminum.
At first it was found difficult to render the
alloy homogeneous, but this difficulty ap-
pears to have been overcome, and the alloy
is now being supplied at the rate of 38s.
per pound. It is said to be harder than sil-
ver and more easily engraved.

THE RAINFALL.—The Nevada Transcript
says that the rainfall of the present season
at Nevada, has been 100.06 inches; within
nine inches of the heaviest ever known in a
single winter.

NEW METHOD OF PRESERVING MEAT.—Professor Gamgee, President of the Albert Veterinary College of London, author of several works upon the cattle plague, and a recognized authority in such matters, has discovered a new process for preserving meats, which he has patented in Europe and America. The process is simple and quite inexpensive. The animal, when practicable, is caused to inhale carbonic (oxide) gas. Before it is quite insensible it is bled in the usual way. When dressed the carcass is suspended in an air-tight receiver, the air exhausted, and the receiver filled with carbonic oxide gas; a small quantity of sulphurous acid gas is also added. After remaining here for from twenty-four to forty-eight hours, the meat may be removed and hung in a dry atmosphere; it will keep for one, two, or three months, or longer, with no perceptible change in taste or appearance. The tests of the method thus far applied have been attended with success. Beef killed in London, in March last, was sent to New York in June, and as late as the middle of July, was shown to a prominent butcher in Fulton market, who did not discover that it was other than ordinary beef, and expressed the opinion that it had probably been killed about two days. Mutton killed in London last July, and sent to this city soon after, is now perfectly fresh, and one piece of beef kept for ten days in a can surrounded by water at a temperature of 90 to 100 degrees, came out perfectly fresh. The process, in the opinion of eminent chemists, does not injure the meat in the least; an advantage very difficult of attainment, even in the case of transportation of live stock, which is liable to the bad effects of confinement and the length of the journey.—*Am. Journal of Mining.*

MODERN WARFARE.—Steam, railroads, the telegraph, iron walls, and lastly iron water pipes, have been brought into requisition to facilitate modern war engineering. Four locomotives are now at work in Abyssinia upon railways connected with the English expeditionary force in that country. One of the latest orders from the British commander was for eighteen miles of water pipe! The first shipload of these pipes sailed from Liverpool in fourteen days from the date on which the telegram calling for the same was received at the war office. The laying of water pipes in an enemy's country by a besieging army, is quite a new phase in military tactics. The telegraph and railroad have now been for some years indispensable adjuncts to an advancing army, and in future years it is more than probable that water pipes will be found equally indispensable. What next?

Copperas! Copperas!

75,000 LBS. IMPORTED COPPERAS-SULPHATE of Iron, for sale in lots to suit, by
BENJ. DRAKE, 108 California street,
S. W. corner Davis, up stairs.

The American Spring Bed.

THIS BED, NOW SO POPULAR IN THE EASTERN and Western States, was patented August, 1886. For practical utility, comfort and durability, it is unsurpassed. It is easily applied to any bedstead. It is portable, and not liable to get out of order. The price is about one-fourth that of the spring mattress. It combines elegance with cheapness and comfort. Call and see it. Mechanics' Institute Building, No. 29 Post street, San Francisco. 8v16-3m

THE UNDERSEIGNED, HAVING BEEN APPOINTED Sole Agent for the Pacific Coast for the sale of ROPER'S BREECH-LOADING SHOT GUN, which discharges four shots in two seconds, circulars will be furnished by applying to or addressing

Rates of Postage on Printed Matter to Europe and Asia.

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen: Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:

NEWSPAPERS—MARKED AS FOLLOWS:

Bremen, by Bremen mail—2 cents each.
Hamburg, by Hamburg mail—2 cents each.
Prussia, Austria and German States, by Bremen or Hamburg mail—3 cents each.
Lunenburg, by Bremen mail—3 cents each.
Lunenburg, by Hamburg mail—3 cents each and 1 cent per 1½ ounce.
Schleswig-Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1½ ounce.
Sweden, by Bremen or Hamburg—3 cents each, and 1½ cent per 1½ ounce.
Norway, by Bremen or Hamburg—3 cents each, and 3½ cents per 1½ ounce.
Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.
Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.
Switzerland, by Bremen or Hamburg—4 cents each.
Italy, by Bremen or Hamburg—5 cents each.
Turkey, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.
Greece, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.
Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 2½ cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mails, via Trieste—3 cents each, and 2 cents per 1½ ounce.

PERIODICALS, ETC.

Bremen, by Bremen mail—1 cent per ounce.
Hamburg, by Hamburg mail—1 cent per ounce.
Prussia, Austria and German States, by Bremen or Hamburg—1½ cent per ounce.
Lunenburg, by Bremen mail—1½ cent per ounce.
Lunenburg, by Hamburg mail—1½ cent per ounce, and 1½ cent per 1½ ounce.
Schleswig-Holstein and Denmark, by Bremen or Hamburg—1½ cent per ounce, and 2½ cents per 1½ ounce.
Sweden, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.
Norway, by Bremen or Hamburg—1½ cent per ounce, and 4 cents per 1½ ounce.
Holland, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.
Russia, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.
Switzerland, by Bremen or Hamburg—1½ cent per ounce, and 1 cent per 1½ ounce.
Italy, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.
Turkey, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.
Greece, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.
Gibraltar, Spain and Portugal, by Bremen or Hamburg—1½ cent per ounce, and 2½ cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mail via Marseilles—1½ cent per ounce, and 9 cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mail, by way of Trieste—6½ cents per ounce, and 2 cents per 1½ ounce.
These charges are in each case to full destination, combining rates between the United States and Bremen or Hamburg, and the rate beyond Bremen and Hamburg to points of delivery.

MOSHEIMER'S

Pioneer Mining School.

Office, 328 Montgomery Street,

SAN FRANCISCO.

MOSHEIMER'S

NEW ROASTING FURNACE.

Patent applied for.

This Furnace has proven the most successful of any ever built on this Coast. A great number are in use now, and many in course of construction. Their superiority over all other furnaces, is as follows:

- 1.—The cost of building is only \$300 for a one ton Furnace.
- 2.—They require less than half a cord of wood per ton of ore.
- 3.—The ore roasted to a spongy condition; while in a common Reverberatory it cakes into globules.
- 4.—It is a saving of 50 per cent. of labor over any Furnace in use.

A full size working Furnace can be seen at my Metallurgical Works in this city, by applying at my office.

JOS. MOSHEIMER,

328 Montgomery street, San Francisco.

A Sulphuret Mine Wanted.

Any party having for sale a Mine, with Gold-bearing Sulphurets, of not less than 15 per cent., and which pay at least \$30 per ton, can find a purchaser by addressing, by writing, particulars to

San Francisco.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out. Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

Pacific Mail Steamship Co's
STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND

BRANNAN STREETS, AT 11 O'CLOCK A. M. OF THE

FOLLOWING DATES, FOR PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from

ASPINWALL, for NEW YORK.

On the 10th, 18th and 30th of each month that has

31 days.

When the 10th, 18th and 30th fall on Sunday, they will

leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at

Manzanillo. All touch at Acapulco.

Departures of 18th or 19th connect with French Transatlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. Co.'s steamer for Central America.

Through tickets can be obtained.

The following Steamships will be dispatched on dates as given below:

March 30th—GOLDEN CITY.....Capt. W. F. Lapidge,

Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—If desired an amount of \$10 to \$20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship CHINA, Capt. Geo. F. Lane, will be dispatched April 14th, at 12 o'clock, noon, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting at Yokohama with the steamer COSTA RICA for SHANGHAI.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

Department of Chemistry,

UNDER

PROF. W. B. RISING.

The Laboratory has recently been fitted up so that each student will be supplied with a set of Chemical Reagents at his own desk.

The Course of Instruction will include a thorough drill in Qualitative Analysis, and advanced students will be furnished every convenience for Quantitative Analysis.

Attention will be given to the detection and separation of poisons.

Also, instruction in the Assay of Gold, Silver, Copper, Lead, Mercury, and other Ores.

Students from abroad, prepared to proceed with the class in the studies of this department, may be admitted on application to the Professor in charge. 5v16fr

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair.

Opinions of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

BANK OF BRITISH COLUMBIA,
San Francisco, May 24, 1866.

Recently, two of Wm. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor and in every way meet our fullest approval.

They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable.

As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, to bring it to possess all the advantages which are claimed for it.

WM. H. TILLINGHAST, Sub-Manager.

We do hereby certify, that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and impossible to be picked. We have applied several vaults and safes, to entire satisfaction to parties interested.

KITREIDGE & LEAVITT,
Pioneer Iron Works, cor. Fremont and Market sts.

SAN FRANCISCO, May 6, 1867.

I do hereby certify, that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safes and Vaults in every other respect as good as any other improved combination lock ever constructed with.

JOHN R. SIMES,
Vault Manufacturer, Oregon Street.

JACKSON, April 27, 1867.

I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons:

1st—Because it is impossible for either burglar or export to pick it.

2d—The lock being constructed without a key-hole, it cannot be blown to pieces by powder.

3d—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making.

R. COSNER.

JACKSON, April 27, 1867.

The undersigned, Treasurer of Amador County, do hereby certify, that I am now using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's safe. I have met with no success in gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe every few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it.

OTTO WALTHER.

Attested by J. C. SHIPMAN, County Clerk.

CALIFORNIA LOCK ABROAD.—A special premium was awarded Mr. W. C. Bussey, for his superior Combination Burglar and Powder-Proof Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the Press several months ago. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable claims asserted in favor of the Lock at that time, have been confirmed since by its practical use. We feel an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates.

(Mining and Scientific Press, Sept. 23, 1866.)

They are the only SAFE lock ever invented. Every State and County treasury vault, and every bank and business place should have one.—[Amador Ledger.]

This is a lock in which a series of rotating annular tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. For which he was awarded a special premium at the State Fair.—[Sacramento Union.]

We, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar Proof Lock to be the most reliable lock constructed.

F. MARKT & C. FLICKSHERL,
No. 18 Post street.

L. MC LAINE.

Any good blacksmith can put this lock on safe doors. Boxes or single old locks removed and this placed in their stead, to work one, two, three or four bolts, as the case may be.—[See page 39 in Pacific Coast Directory.]

A deaf or blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination.

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of March, 1868, an assessment of two (\$2) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 318 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twentieth day of April, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the sixth (6th) day of May, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.
Office, 318 California street, up stairs, San Francisco, California. mar21

Sucreo Gold and Silver Mining Company.—Location of Works: Storey County, State of Nevada.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the tenth day of February, 1868, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Aldrich, Lewis	143	79 1/2	\$39 40
Aldrich, Lewis	144	44 1/2	22 25
Aldrich, Lewis	166	151 1/2	75 77
Laird, James D.	51	20	10 00
Ober, Benjamin	71	5	2 50
Ober, Benjamin	72	5	2 50
Ober, Benjamin	73	5	2 50

And in accordance with law, and an order of the Board of Trustees, made on the tenth day of February, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., No. 418 Montgomery street, San Francisco, on the fourth day of April, 1868, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

E. J. MOORE, Secretary.
Office, Nos. 77 and 78 Montgomery Block, San Francisco, California.

POSTPONEMENT.—The above sale is hereby postponed until Saturday, the eleventh day of April, 1868, at the same hour and place. By order of the Board of Trustees.

mar21 E. J. MOORE, Secretary.

San Francisco and Castle Dome Mining Company. Location of Works: Castle Dome County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-sixth day of February, 1868, an assessment of ten cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Treasurer, J. A. Gaddis, No. 320 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the thirtieth (30th) day of March, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-first day of April, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. R. SMITH, Secretary.
Office, Room No. 16 Stevenson's Block, Cor. Montgomery and California streets, San Francisco. feb29

Ventana Gold and Silver Mining Company.—Location of Works: Durango, Mexico.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the eighth day of January, 1868, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
C H Robbins	38	22 1/2	\$35 75
E W Taggard	312	165	247 50
M A Thompson	333	5	7 50
E Whiting	138	5	6 00
E Whiting	313	10	15 00
J L Whitnall	not issued	20	30 00
M E Hall	134	2	3 00
M E Hall	137	1	1 50
M E Hall	139	5	7 50
M E Hall	136	18	27 00
Mrs D A Powers	205	2	3 00
Mrs D A Powers	138	2	3 00

And in accordance with law, and an order of the Board of Trustees, made on the eighth day of January, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, S. W. corner

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
1st San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO.,

NOTICE TO MERCHANTS
—AND—
MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength; less danger in working; as goods require no slinging or landing; consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any lashing or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

VULCAN IRON WORKS CO.,

CHAS OTTO & CO.,
22v15-3m 312 Bush street.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.

The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600
No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour—price, \$850
No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour—price, \$1,200

EXPLANATION OF THE ABOVE ENGRAVING.
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Filton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1886.
JAMES BRODIE, Esq., San Francisco.—My Dear Sir: I have the pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
R. F. JOHNSON,
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1884. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the Improved German Barrel, for a longer term than twelve months. All persons desirous of compromising, without having recourse to legal proceedings, for past infringements, or desirous of receiving Letters of License for the limited period named are requested to address below.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1886.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1886.

JAMES BRODIE, Esq., Filton Foundry, or CHARLES RANCLIFFE, Express Building, 402 Montgomery street, San Francisco. 12v13f

THE CELEBRATED
Self Generating Portable
Gas Lamp.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn on the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained until the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burner must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor, Factory, North Beach, San Francisco, and for sale by his agents in every city and town throughout the State. 18v14-3m-8

BLAKE'S PATENT
QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1886.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

PENNSYLVANIA COAL MINES.—We extract the following from the JOURNAL report of the Department of Agriculture: "The mineral wealth of Pennsylvania is well known. Our returns are full of references to the rich iron ores, in many places extensively worked, of the entire length of the Susquehanna valley, of the Schuylkill and Lehigh regions, and of the western slope of the Alleghenies. The anthracite coal, of the eastern and northeastern sections of the State, is of great value; and the bituminous varieties, of the northwestern and western sections, are not excelled in yield and quality by any coal of that character in any coal lands of the United States. In Elizabeth township, Allegheny county, our correspondent estimates \$365,000,000 worth of coal at four cents per bushel, and that at one cent per bushel the coal finding an outlet from the Monongahela river would suffice to pay the national debt. The following description of mining here is thus given:

"The principal vein is called the 'six foot vein,' and dips towards the south, so that at Pittsburgh it is about 400 feet above low water, and at Brownsville is at the water's edge—the distance being 60 miles. The coal is taken from the miner's rooms by wagons, containing usually 25 bushels, and hauled by mules to the mouth of the pit and let down the hill by cable on a railway constructed for the purpose; the loaded wagon drawing an empty one up to the pit. A mine in good order and well worked will produce about 8,000 bushels per day. Four cents per bushel is paid for digging. Many things conspire to prevent constant and regular work, such as very low water, very high water, ice in the river, and occasionally dullness of sale at Cincinnati and other markets below. At the present time, owing to the low water, we have millions of bushels in boats awaiting the 'moving of the waters.' It is estimated that there are \$3,500,000 worth. I consider that our coal trade is as yet in its infancy, and this results from the want of capital as much as from any other cause. Good coal lands vary in price from \$50 to \$500 per acre, owing to their situation in regard to the slack-water."

MIXTURE OF RACES.—Agassiz says on this subject: Let any who doubts the evil of this mixture of races, and is inclined, from a mistaken philanthropy, to break down all barriers between them, come to Brazil. He cannot deny the deterioration consequent upon an amalgamation of races, more wide spread here than in any other country in the world, and which is rapidly effacing the best qualities of the white man, the negro and the Indian, leaving a mongrel nondescript type, deficient in physical and mental energy. At a time when a new social state of the negro is a subject of vital importance in our statesmanship, we should profit by the experience of a country where, though slavery exists, there is far more liberality toward the free negro than he has ever enjoyed in the United States. Let us learn the double lesson; open all the advantages of education to the negro, and give him every chance of success which culture gives to the man who knows how to use it; but respect the laws of nature, and let all our dealings with the black man tend to preserve, as far as possible, the distinctness of his national characteristics, and the integrity of our own.

LARGE BELT.—There is now, says the American Journal of Mining, in course of manufacture at a leather belting factory in this city, what is said to be the largest leather belt ever made. The width is 47 inches; length, 200 feet; weight, 18,000 pounds; and cost \$2,000. It is composed of triplicate layers of leather, making a thickness of three-quarters of an inch, and cemented and pressed so firmly together that it has the appearance of one solid piece.

UTILITY OF THE SAFETY CAGE.—By accident the cable became detached from one of the safety cages at the Imperial-Empire hoisting works, last Saturday, allowing the cage to fall into the shaft. The cage fell but a few inches before the safety apparatus firmly clutched the guide timbers on either side of the shaft and the cage was stopped. The shaft is 900 ft. deep, and but for the safety arrangement parties at work at the bottom would doubtless have been killed. Virginia Enterprise, March 10th.

SOURCE OF ALUMINUM.—Cryolite is the mineral from which aluminum is obtained in largest quantities. It is obtained in large quantities from Greenland. Aluminum is increasing in favor rapidly, as a most beautiful metal capable of superseding silver for many purposes. Bryalite is used in certain metallurgical operations with great profit. The application is kept a secret. Gas Light Journal.

A SCIENTIFIC BILL OF FARE.—The *American Journal of Mining* quotes this anecdote, told by the Paris correspondent of the *Chemical News*: A visitor to a prison asked, are the prisoners well nourished? "Mon Dieu Monsieur," said the guide, "the bill of fare for each day has been prepared by a special commission:—it is 33 per cent. nitrogenous matter, 27 albuminoid, 15 of gelatine, 18 of fibrin, 7 of hydrated matter!" The *Journal* remarks in this connection that the experiments of Messrs. Fick & Wislizenus, "have changed all that," and determined that it was hydro-carbon, and not nitrogen, which supplies the motive power. In that case, the French prisoners were simply the victims of science. The *Journal* continues: "Votaries of science though we are, we feel a disinclination to this method of uniform feeding, according to chemical reactions. We prefer a bill of fare to a certificate of analysis. Azote has not for us the charms of beefsteak, nor will hydro-carbon tickle our palate like sugar. Besides, even if men are nothing but peripatetic chemical laboratories, they are not all alike. These abstract theories ignore a class of facts (such as nausea, and the agreement or disagreement of particular foods with particular individuals) which enter into the philosophy of life quite as really as the equations of chemistry. We are willing to have our constituents determined; we recognize the interest and value of theories as to how we live and move and have our being; we are content to consider everybody but ourselves but a mere compound of bone and tissue, or other forms of solidified gas; but we do not consider ourselves 'in that bony light,' and we would rather trust our physician, or still better, our own experience, on the subject of our diet, than the profoundest chemist that ever lived."

All About Sending Money by Mail.

RATES OF COMMISSION.—The following are the rates charged (in currency) for transmitting money to any part of the United States:

On Orders not exceeding \$20.....10 cents.
Over \$20 and not exceeding \$50.....15 cents.
No fractions of cents to be introduced in an Order.
United States Treasury Notes, or National Bank Notes only received or paid.
To send over \$50, additional Orders must be obtained.
Post Offices where Money Orders may be obtained will furnish blanks as follows, which the applicants will fill out:

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1861; July 21, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED
FOR
Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES
Fifty Per Cent.
LESS POWER
Than any Blower
now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Atna Iron Works, San Francisco, and many other places.
CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

SPIRITS OF TURPENTINE & ALCOHOL

NOTE.—We would specially call the attention of Mill owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning oil.
A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

Lamps and Lamp Stock!
An elegant and complete assortment on hand.
1913-3m 414 Front street, San Francisco.

Our Patent Agency.
THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

MECHANICS' Mill and Manufacturing Co.

Cor. Mission and Fremont streets,
SAN FRANCISCO.
Formerly James Brokaw, Proprietor.

This establishment is now under the control of a Joint Stock Company, composed of the old employees, is supplied with all the

Modern Improvements in Machinery,
And has the best facilities in the State for furnishing Building with every description of WOODWORK FINISH.
All orders promptly and carefully attended to.

A SAFE,
CERTAIN,
AND
Speedy Cure
FOR
NEURALGIA,
AND ALL
NERVOUS
DISEASES.
Its Effects are
Magical.

It is an UNFAILING REMEDY in all cases of Neuralgia Facialis, often effecting a port-cure in less than twenty-four hours, from the use of no more than two or three PILLS.
No other form of Neuralgia or Nervous Disease has failed to yield to this

WONDERFUL REMEDIAL AGENT.
Even in the severest cases of Chronic Neuralgia and general nervous derangements,—of many years standing,—affecting the entire system, its use for a few days, or a few weeks at the utmost, always affords the most astonishing relief, and very rarely fails to produce a complete and permanent cure.

It contains no drugs or other materials in the slightest degree injurious, even to the most delicate system, and can ALWAYS be used with

PERFECT SAFETY.
It has long been in constant use by many our most EMINENT PHYSICIANS, who give it their unanimous and unqualified approval. Sent by mail on receipt of price, and postage.

	Price.	Postage.
One package.....	\$1 00	6 cents.
Six packages.....	5 00	27 "
Twelve packages.....	9 00	43 "

It is sold by all wholesale and retail dealers in drugs and medicines throughout the United States, and by

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

PACIFIC ACADEMY OF MUSIC.—March 20th. Capital stock, \$250,000; 2,500 shares, \$100 each. Trustees: Ben. Holliday, Chas. E. McLean, Milton S. Latham, I. Friedlander and Tiburcio Parrott.

RATTLESNAKE MINING Co.—March 20th. Capital stock, \$240,000; 1,600 shares, \$150 each. Trustees: A. N. Huard, W. B. Agard, A. Noel, A. Courcelle and E. Van Muller.

CAPITAL HOMESTEAD ASSOCIATION.—Mar. 20th. Capital stock, \$32,025; 105 shares, \$305 each. Trustees: James F. Crossett, William F. King, Frederick G. Smith, Wm. B. Rand and Henry R. Gregory.

ST. LUKE'S CHURCH.—March 20th. Trustees: Frank M. Pixley, J. G. Clark, J. W. Shaeffer, A. C. Hubbard, Robert George, S. H. Davis, Richard Crooks, Louis F. Haltz, M. M. Estee, James M. Taylor, Lewis P. Sage and Wm. R. Wadsworth.

PACIFIC ELASTIC SPONGE Co.—March 24th. Capital stock, \$50,000; 500 shares, \$100 each. Trustees: W. R. Strong, H. N. Connell and A. S. Ferris.

COLLEGE HOMESTEAD ASSOCIATION.—Mar. 26th. Capital stock, \$150,000; 500 shares, \$300 each. Trustees: S. F. Michel, Warren Dutton, C. H. Pollard, L. L. Robinson and Robert Ockell.

UNION MILL AND MINING Co.—March 27th. Capital stock, \$1,500,000; 1,500 shares, \$100 each. Trustees: Wm. E. Barron, Thos. Bell and Thos. Snnderland.

SMELTER WANTED.—Any person with good references, capable of taking charge of one of the shifts of a furnace employed in the reduction of argentiferous lead ores, can learn of a situation by applying at this office. See advertisement in another column.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

DISEASES OF THE EYE.—During a late visit to San Francisco, we fell in with an old acquaintance from this county, Mr. G. W. Purdy, who formerly resided at Forrest City. About two years ago, while under treatment of himself, we saw Mr. Purdy at the office of an oculist in that city, with eyes badly inflamed and the sight entirely lost. We saw him a few months later at another physician's, but his case was scarcely improved, and seemingly hopeless. His eyes have now entirely recovered, so that he goes about his ordinary business. From his own lips we learned that the restoration of his sight was entirely due to Dr. D. R. Morgan, whose office is at No. 627 Sacramento street, between Montgomery and Kearny, who cured him in the short space of eighteen weeks. Mr. Purdy mentioned several remarkable cures which occurred in the practice of Dr. Morgan during the time he was under treatment, among which was that of Mrs. Jane Albert, of Brownsville, Yuba County, and several others. Mrs. Albert had been afflicted with sore eyes from early childhood, and for eleven months previous to treatment she had not been able to discern light, nor had she seen the features of her youngest child, twelve months old. She had heard of the remarkable cure of Leonard F. Eder, of Marysville, and Joseph E. Haskell, of Sacramento, and determined to try Dr. Morgan. The result was that she was able, after ten days, to read ordinary newspaper print. Mr. Purdy was of course greatly rejoiced at the recovery of his sight, after so many trials and fatigues with different physicians.

The above is clipped from the *Mountain Messenger*, of February, 1863. 10v16 3m

**ENLARGEMENT
OF THE
American Journal of Mining
Volume III, Commencing March 3.**

In consequence of the remarkable success that has attended this Journal, the proprietors feel warranted in increasing its size to

Twenty Pages,

Thus making it the LARGEST and most COMPREHENSIVE Mining Journal on this continent, representing the Gold, Silver, Copper, Iron, Lead, Coal, Slate, Oil, and in fact all the Mineral Interests of America, containing beautiful engravings illustrating the latest improvements in mining, mining and metallurgical machinery.

The Journal has won the encomiums of the press of the entire country and Europe, and numbers among its contributors more eminent scientific men than any other weekly publication in America.

The reports of the markets in stocks, metals, minerals and ores, carefully corrected weekly, are an important feature of the Journal.

Subscriptions: \$4 per year; for six months, \$2.25—in advance; single copies, 10 cents. Specimen copies sent free. Address, **WESTERN & COMPANY,** Publishers, 37 Park Row, N. Y.

PAINE & STEPHENS' IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary buddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about \$1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the *Mining and Scientific Press* of March 21, 1868.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to **THOMAS N. PAINE**, Grass Valley, California.

PAINE & STEPHENS.

HANSBROW'S CHALLENGE Deep-Well, Mining and Double-Cylinder Patent Pumps.

Six-Inch Mining Pump.

These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, **GODDARD & CO.**, and for sale by the Agents, **LOCKE & MONTAGUE**, 112 and 114 Battery Street, San Francisco. Send for a descriptive Circular.

[Editorial Correspondence.]

Work at the Hoosac Tunnel.

WESTFIELD, Mass, Feb. 12, 1868.

NOTE.—It is intended to state facts as briefly as possible in this article, mainly from notes and observations made Nov. 18th and 19th, 1867. The object is to afford a more direct railroad thoroughfare, with light grade, from Boston to Troy.

[Continued from Page 193]

FOUR POINTED DRILLS, with cross-shaped (+) edges, are used in the machines; steel $1\frac{1}{2}$ -inch; cutters 2 to 3-inch bit. The drills are shaped with a sledge. Sanderson's steel, manufactured in Sheffield, Eng., is principally used.

CHARLES BURLEIGH, INVENTOR

of these drills, is an owner and superintendent in the works of the Putnam Machine Company, an extensive and prosperous establishment in Fitchburg, Mass. Mr. Burleigh had charge of manufacturing a number of machine drills, under direction of the State Commissioners, which worked effectively at first, but ultimately proved a failure, by reason of constant breakage. Observing the difficulties encountered with the first machines, and discerning the true remedies, he constructed an article which has proved efficient, saved the State already, in cash, \$100,000,—and probably the tunnel from abandonment. The patent for this machine is now owned by the Burleigh Rock Drill Company. The Putnam Machine Company have recently constructed a building specially for the purpose of exhibiting the drill in operation. It is the intention of the inventor to have one of the machines exhibited at the Mechanics' Institute Fair, in San Francisco, this season. It might help the Sutro Tunnel out,—or in, rather.

Over \$30,000 has been expended in perfecting the Burleigh machine, and the purchase of conflicting patents. The patent of J. W. Fowle, dated March 11, 1851, was bought by Mr. Burleigh in 1865. A reissue was secured June 1, 1866, claiming the attachment of a drill bar to a reciprocating piston, driven by air or steam. Another patent is dated Nov. 27, 1866. Mr. Burleigh thinks the

FIRST DRILL EVER PATENTED

was a Z-shaped cutter, of large size, to work by horse-power, by Mr. Singer, of Lockport, N. Y. His patent was dated about 1836.

A company of contractors engaged in deepening the Illinois Canal, between Lock-

port and Chicago, for the better drainage of the latter city, are using a much larger class of Burleigh machines than those described. They have a 12-inch cylinder and 14-foot piston, driving a 5-inch Z drill, which shape is favorable for soft rock. During the third week in January, one machine drilled 434 feet, the bores averaging seven feet deep each. The contractors have seven miles of rock excavated.

OPERATING THE DRILLS—ELECTRICAL FIRING.

Two men attend each drill. The holes are made from three to five feet deep. When a sufficient number are drilled—about thirty—the drill carriages are rolled back from 100 to 200 feet, past the gates. The holes are then charged with gunpowder, and electric exploders. [This exploder, and its mode of operation, was described in our

After the blasts, the trucks for removing the rock are brought forward, as are also the flexible air tubes, which furnish a volume of air sufficient to quickly clear the heading of smoke. The broken rock removed, the drills are pushed forward and quickly put in operation. Sufficient air is exhausted by the drills, while running, to render the atmosphere quite fresh, and we might say agreeable, but for the fine floating dust produced from the bores, which accumulates rapidly enough to soon change the color of one's suit into light gray.

Six blastings are made in twenty-four hours,—four hours being employed to each blasting,—one for drilling and three for charging, firing and cleaning away. From five to seven feet advance is now made per

consists of four cylinders of 25-inch diameter and 20-inch stroke, arranged in a circle of about twelve feet diameter. These are worked with one crank and side rods, the crank being fast to the journal of the turbine. A 1-16th inch jet of water is forced with 104 pounds pressure through the pistons, to allay the heat generated by compressing. These compressors are run at forty revolutions per minute, and are capable of furnishing 280 horse power. They supply air for ventilation through a 12-inch iron pipe 4,200 feet in length. Four smaller compressors, with cylinders of 13-inch diameter and 20-inch stroke, arranged same as above, run at 120 revolutions per minute, furnish air for working the drills, and are capable of giving 125 horse power.

PNEUMATIC CONDUCTING TUBES.

By this machine the air is forced 4,200 feet, through 8-inch pipe, connecting with some 400 feet of 4-inch pipe. Then comes 200 feet of portable 4-inch rubber pipe leading to the heading. Attached to the latter, are two sections of smaller flexible hose leading to the drill carriages, where the volume of air is again subdivided and conducted through still smaller tubes to each individual drill. Thus the power of the falling water is caught by the turbines, "hottled up" by the compressors, and used in the tunnel at a distance of over a mile.

The 4-inch iron pipe is made in 6-foot sections, weighing 66 pounds each, and costing \$3.50. It is cast with with bolt holes and face perfect enough for use without finishing. Pressed paper is used for packing the joints. No serious difficulty is experienced from leakage. Rubber hose is most expensive and least durable; but its use for following up the heading, and the ease with which it is coupled and uncoupled and removed from danger on the occasion of blasting, renders its service indispensable. It occasionally bursts. Jones' (Philadelphia) patent coupling is attached to the rubber hose. The coupling is done instantly, by pressing the ends of the pipe together, spring, clamps, clasping and holding them firm. An inner ring of rubber is forced outward by pressure of the air, rendering the joint self-tightening.

Mr. Hall tested, by mercury gages, the loss of power in the first 2,800 feet of pipe, finding it to be 1 lb in 35. The same test, applied to the next 1,800 feet, indicated a loss of 5 lbs in 35. In the latter case, the use of two sizes of pipe may account for a large proportion of the loss. It requires 3-horse power from the water wheels to produce one at the heading.

THE NEW BLASTING POWDER.—An important series of experiments have been made the past week near the Mission, to test the safety of the new dynamic powder. It is claimed that the results show that this powder is more safe to handle and transport than common gunpowder.

THE engineer of a steam saw-mill in Bristol, Indiana, is a woman. She keeps everything as neat as a parlor, and has a little piece of carpet by the side of the cylinder.

BURLEIGH'S PATENT PNEUMATIC ROCK DRILL.

We have had engraved and give herewith an illustration of the Burleigh Rock Drill, referred to by our correspondent as proving so useful and effective at the Hoosac Tunnel. This drill is said to combine the advantages of simplicity of construction, great strength of parts, compactness and lightness, weighing from 300 to 1,000 pounds, according to size. It is made for drilling holes from one and three-fourths to five inches in diameter. It is convenient, easily handled, not liable to get out of repair, and is said to be in every respect the most practical drilling machine ever devised. It will drill from two to six inches per minute, according to hardness of the rock. It is also claimed that the drill points will advance several times more at each sharpening than when operated by hand and sledge. This is said to be proven by records kept at the Hoosac Tunnel, where these machines have been in constant use, night and day, for the last fifteen months. This machine is so constructed that the piston bar is the only part of the machine which receives the shock resulting from the blow upon the rock. This piston bar, to which the drill-point is directly attached, is made from a solid bar of cast steel. With a pressure of fifty pounds to the square inch, the drill strikes the rock from 250 to 300 blows per minute. It is provided with an automatic feed and rotating device, by means of which the drill is partially rotated at each stroke, and advanced toward the rock as required. The machines vary in size from fifty inches length, and cross section of 12x15 inches, to eighty-four inches, and cross section of 14x16 inches, and will feed forward, without change of drill-points, from thirty to eighty-four inches, according to size of machine. The above illustration will convey a very intelligible idea of the mode of constructing the drill.

correspondent's letter published February 29.] Attached to each exploder is a small copper wire, connecting it with the main wires leading a safe distance to the battery. The wires are all insulated with gutta percha. When every charge is connected with the battery, the signal is made, two or three turns are given to the crank of the battery, a knob is pulled and the thirty charges explode together, uniting their terrible strength against the adamantine rock. Of course the noise and effect is greatly augmented by this simultaneous explosion. Besides, the fulminating powder of the exploders ignites the entire charge of powder at once, which is not the case with ordinary fuse. In the central shaft this method of blasting alone advanced the work from 18½ to 23 feet per month. It is surer than with fuse, and is considered cheaper in large operations.

Sixty men are employed here, including carmen, etc., working eight hour shifts. During 1867, this heading was advanced 1,051 feet,—an increase of 459 feet over the previous year.

THE MACHINE SHOP,

situated a few rods from the tunnel, presents much interest. Mr. Wm. Hall, superintendent, appears well versed in his business, judging from his intelligent exposition of the work in his department. Here is seen the mechanism of the pneumatic drills in use, and relics of experimental and rejected devices. Mr. Hall claims decided improvements made by himself in the drill from time to time. Two 6-foot turbine wheels supply power for the shop. Additional turbines are being set for use.

COMPRESSING ENGINES.

The basement story is occupied by two sets of compressing cylinders. The largest

[Written for the Mining and Scientific Press.]

San Francisco Earthquakes.

BY DR. JOHN A. VEATCH.

As these not very desirable visitors come to us with uncomfortable frequency, it becomes a matter of interest to inquire into the probability of their continued gentle demeanor, or whether some energetic quake may not, ere long, be rude enough to make a ruinous smash of things, and smother us in the crushed fragments of our own homes. As we live on a coast where volcanic agencies have left proofs of former activity, and where numerous hot springs and sulphurous emanations attest that their smouldering fires are not yet extinguished,—the event above contemplated falls largely within the limits of the possible. But is it probable?

Without stopping to investigate the theory of the *modus operandi* of earthquakes, I shall only allude to the fact of their occurrence in maximum force and frequency in the vicinity of volcanoes subject to alternate fits of repose and activity. They also linger for ages in such localities, after all other external volcanic manifestations have totally ceased; decreasing in strength and frequency as the hand of Time heals and smooths over breaks and ruptures, and soothes the subterranean fires by opening other and distant outlets,—until they come, finally, only at long intervals, in gentle tremblings, like an age-enfeebled warrior re-visiting his youthful battle-fields. Shocks of more or less violence precede volcanic eruptions, and ease off as the craters open and the external flow of lava is established; proving their intimate connection with the pent-up fluid matters struggling to escape. The violence affecting any given point within the area of agitation is of course in proportion to its distance from the center of disturbance,—other conditions being equal. The irregular surface, the heterogeneous material and variable tenacity of the crust produce ever-varying effects upon different localities of a district simultaneously disturbed by a wide-spread force, causing the false appearance of many independent local actions. Local and circumscribed disturbances doubtless often occur; the earth-wave expanding concentrically from a central focus. These waves are, however, usually propagated along a line of maximum intensity, as in the course of a volcanic mountain chain.

The point of interest with us is to determine this central line of intensity in the matter of our own earthquakes. There are probably three of these lines, corresponding with the Sierras, the Coast Range, and a submarine range west of and parallel with the last named, along which lines our earth-waves travel; and from points within which local shocks radiate. If we take the number of heat-vents still existing as a measure of intensity of the fiery activity lingering yet beneath these mountain ranges, we will find the Coast Range far exceeding the Sierras in that regard. The *submerged range* I infer to be far more active than either of the others. Its existence is matter of theory, based, however, on two strongly suggested facts. First, there is a sunken ridge, known as the Cortez Shoals, seventeen miles long, lying southwesterly and distant forty-six miles from the island of San Clementes, and pointing in a direction parallel with the coast. It is suggested in the Report of the Coast Survey for 1862, that other similar developments might be looked for in a line with this. (See Coast Survey Report for 1862, page 286.) Second, this shoal, or sunken ridge, is *volcanic*, according to the statement of Captain Cropper, of the steamer Cortez, who reported seeing the eruptions. A volcanic product, boracic acid, is found in the sea water from about this point northwards along the entire California coast, and even to Puget Sound. This unusual component of sea water is found within a narrow belt along the shore, not more than thirty or forty miles wide,—rendering it probable that a line of volcanic emanations exists within the length and

breadth of that space,—rendering it probable, too, that Captain Cropper was *not* mistaken, as has been assumed in his statement.

The Coast Range presents the same peculiarity of yielding boracic acid, along with the hot sulphurous waters of its numerous mineral springs. At a few points boracic salts exist to a very large extent, as at the well known "Borax Lake." The entire product of the Coast Range is insignificant, however, compared with the great submarine supply. The quantity is not sufficient to be detected in even the larger rivulets, draining the mountains, to say nothing of the rivers and the sea itself, into which they empty. Therefore, the presence of the acid in the shore waters of the ocean cannot be accounted for on the hypothesis of being brought from the coast mountains.

The ocean supply can only be accounted for on the supposition of a submerged volcanic chain of considerable activity, yielding boracic acid in large quantity.

If the theory is correct, we may rationally locate the focus of disturbance of our hardest earth-shocks on this line. Although shocks doubtless emanate from the Coast Range line, yet their comparative strength and frequency would probably be in proportion to the relative activity of the two lines.

I therefore conclude, that San Francisco is removed considerably from the central disturbance of either the coast line or submarine line of earthquakes; that the intensity of the shocks will therefore be always greatly mitigated; and that the fury of the heaviest shocks will be expended on the sea waves thirty or forty miles from the shore; and therefore the shore is probably safe from any destructive violence.

COURSE OF THE EARTH WAVE.

Our shocks seem generally to come from the south and proceed north. If we imagine our earth-wave having its center of disturbance in the submerged line above named, and moving along it towards the north, spreading out its wings on either side as it rolls onward, the result would be as the shore wave passed under San Francisco, to sway perpendicular objects first to the north, or perhaps to the northeast, and then back again, uplifting at the same time. Two or more of such movements might occur, and they would follow the reactionary wave falling in the wake of the central disturbance, to fill up, as it were, the depression produced by its onward movement. This would cause an inclination of perpendicular bodies, first towards the west and then towards the east, nearly at right angles with the first movements. These two classes of movements are actually observed in most cases where both the initial and closing motions are noted. They prove conclusively that the center of disturbance passes on one side, and not under the city; for in the latter case the movement would be only back and forth in the direction of the passing wave.

Shocks where the first heave is toward the north and east, probably are located in the marine line of disturbance, the wave moving north; those giving a southwest heave probably come from the coast line, the wave moving in the same direction.

It is to be regretted that no systematic mode of observation has heretofore been applied to these interesting phenomena. It is to be hoped some of our scientific men may have the means and leisure ere long to establish some mode of noting, with comparative accuracy, the details of earthquake action.

San Francisco, March 31st, 1868.

GODOLPHIN.—The following is from a small book recently published in England, entitled, "The Mining Fields of the West:" "At the east foot of the Godolphin Hill there is a dreary looking valley, filled with mounds of broken rock and crumbling ruins, marking the site of the old Godolphin mine, which was formerly so rich. Here also is situated in close proximity to the remains of the old mine, the mansion of the now extinct family of the Godolphins. Although gone very much into decay, and altered to adapt it to the requirements of a modern farm house, sufficient of this fine old building remains to attest its former grandeur, and to show that it was once the residence of a great family. It is still surrounded by trees, the remains of the woods which, without doubt, at one time occupied a much larger area, clothing the neighboring valley, and extending up the hill. The valley, which now looks so desolate, must have presented at one time a very different appearance—filled with foliage, affording cover for game, and watered by pleasant streams, in which fish abounded. This place was the seat of Earl Godolphin.

The Pacific Woolen Mills.

As manufacturing is becoming such an important branch of industry in San Francisco, and as the woolen manufacturers have peculiar advantages in this State, it would be useful and interesting to know the process of converting wool into the various articles of under-clothing, as we recently witnessed it at the Pacific Woolen Mills in this city. There is a great deal that we can find that is interesting about stockings, and before speaking of the manufacture of them we will briefly consider their history.

Stockings were not used by the Romans, even when they had attained their highest civilization; and they were quite unknown to any of the other great nations of antiquity. The Northmen first wore a garment they called hose or trousers, which extended from the waist and covered the lower limbs; a few centuries ago this was converted into two articles of clothing—the upper part retaining the old name, trousers or hose, and the lower part being called half-hose. They were first made of cloth, by the tailor, and were therefore very clumsy, and often formed a great impediment in walking, especially to a pedestrian traveling a long distance. The modern stockings are a kind of fabric formed of an innumerable quantity of little knots, called stitches, loops or meshes, intermingled with one another. The operation of making these meshes is called knitting; it is exceedingly simple, acquires no straining of the eyesight, no unhealthy position, and can be performed as easily and as conveniently when walking as when sitting. It is doubtful to what nation we are indebted for the invention of knitted stockings; some attribute it to the Scots, on the ground that the first works of this kind came thence; they also say that it was on this account that the company of stocking knitters, established in Paris in 1527, took for their patron, St. Fiacre, who is said to have been the son of a king of Scotland. The most prevalent opinion, however, ascribes the honor of the invention to the Spaniards, and fixes its date in the sixteenth century. The name of the inventor is entirely unknown.

The stocking loom was invented in the year 1589, by William Lee, a native of Nottingham, England, and Fellow of St. John's College, Cambridge. The French have strongly contested this point with the English, but the only claim the former can lay to the invention, is based on the fact that Lee first made it public in France, after despairing of its success in his own country. It is an exceedingly complicated machine, consisting of 2,000 parts. Aston, an apprentice of Lee's, made some improvements in the loom, and laid the foundation of the stocking manufacture in England. In 1663, he, with seven others, received a patent, which gave them certain privileges to an extent of ten miles around London. In 1758, a machine for making ribbed stockings was patented by Mr. Strutt, of Belper. In 1838, stocking frames, with a rotary action similar to those now universally employed, were successfully brought into use in Nottingham.

Silk stockings were very expensive about the time of Queen Elizabeth, and were only worn on very grand occasions; according to Gascoigne, the poet, the greatest ornaments in dress were knit silk stockings and Spanish leather shoes. Woolen stockings were quite common about this time, but cotton ones were not introduced till after the 17th century.

Having thus given a short sketch of the history of stockings, we will now proceed to their manufacture, which is illustrated in the Pacific Woolen Mills. This factory is situated on Folsom street, between Eighteenth and Nineteenth. It is a large, four story brick building, with extensive rooms well lighted and airy. The yard occupies the whole extent of the block. In connection

with the mill, all merely mechanical labor is performed by Chinamen, of whom there are about sixty employed. About twenty white men are engaged in work that is more complicated, or that requires more ingenuity and skill in its performance. They use about 250,000 pounds of wool and 150,000 pounds of cotton annually. The wool is received in the fleece, which frequently contains eight or ten different kinds. It is first divided into coarse and fine; the former is long and either straight or irregularly curled, the latter is regularly curled. It is next sorted into parcels according to its fineness, strength, color, cleanness and weight; it requires much practice to be able to sort it, and to distinguish those differences which are not perceptible to common observers. The wool is next placed in a large iron trough filled with a strong mixture of soap and alkali;—a machine called a scourer, then moves the wool about until it becomes thoroughly impregnated with the mixture, which frees it from the natural grease. It is then taken to a large platform in the yard, and spread out to dry. In a few hours it is ready for the picker,—a complicated machine of recent invention, which removes all hurs and sandy and loose impurities from the wool. Before the invention of this machine, the wool underwent the process of willing or willowing; its object being to separate or disconnect the locks and remove all loose impurities. As this does not always have the desired effect, either boys or women, called wool moaters, are employed; the locks are afterwards more thoroughly separated by the process of cribbling. The wool when quite clean is put in a mixing picker, next carded, and then spun into yarn. The old method of spinning yarn is very laborious in comparison with the improved method now in common use. The wool by means of the old fashioned spinning jenny was brought into a soft, weak thread, the spinning machine converted it to the proper size; it then remained to be wound, before it was ready for weaving. By the invention of a very ingenious machine, the self-acting mule, much time and labor is saved,—the spinning and winding all being performed on this one machine. The wool is now ready to be woven. The webbing for making the shirts and drawers is produced on a circular knitting frame, containing a great number of steel needles, working at the rate of 200,000 stitches a minute. These machines turn out fifty dozen of shirts and drawers a day. The stocking frames are rotary in action, and the operation is similar to that of the larger frame, just mentioned. Some looms make ribbed work, others plain, but both are capable of producing stockings of every degree of fineness and coarseness,—and of every shape, size and color. They turn off about 150 dozen of stockings per day.

This is the last manufacturing process; the goods are now cut out and shaped in various sizes—after which they are given out to be stitched and seamed. This gives employment to about 200 women of the city. When returned they are cleansed in a washing machine, and then dried in a hydro-extractor or centrifugal machine, which moves with great velocity, making a thousand revolutions in a minute. The articles are now either bleached or colored, after which they are pressed. The machine used for pressing the shirts and drawers, is the first that has ever been constructed in America. It was made at the East expressly for this factory, and was examined by many manufacturers and scientific men there. About fifty girls are employed in trimming the shirts and drawers, and on the sewing machines which are run by steam power, making 2,000 stitches a minute; an advantage of nearly 1,500 stitches a minute over those run by the foot. These are the only sewing machines worked by steam on the Pacific coast. The boxes in which the goods are arranged for market, are made on the premises, the card-board is imported from the East, and the machinery used for making them is the latest and the most perfect of its kind. There are about 145 varieties of goods finished here.

These mills are capable of turning out goods to the amount of \$350,000 per annum. They are now setting up machinery to make the best fashioned work, which has hitherto been imported from England. They will then have facilities for manufacturing half a million dollars worth of goods, which in quality will be well able to compete with the finest produced in the world.

ARTIFICIAL IVORY.—Artificial ivory may be made by dissolving 12 oz. amber, and 3 ozs. Kouriegum, in wood-spirits, or alcohol; then adding 7 ozs. of fine china-clay, and mixing together thoroughly by stirring, aided by a gentle heat. The composition is then to be placed in dies, and made into the required form.

Mechanical.

STEAM ON COMMON ROADS.—M. Larmen-jat has contrived a steam carriage, in which, by two small driving wheels placed inside the larger ones, the force of traction can be largely increased at will. A communication to the *London Mining Journal*, thus speaks of it: The substitution of one pair of wheels for the other is effected without stopping the engine, by a very simple mechanism. One can understand that with one of these engines we can attain on common roads a velocity of seven to ten miles an hour with a load; if at a given moment we can reduce the velocity of the engine from ten to two and one-half miles an hour, still keeping up the velocity of the piston, its power will be increased fourfold. This is done by lowering the inner driving wheels, and raising the outer ones from the ground.

As a first essay, the machine which worked at the Exhibition, of 3-horse power, started from the Auxerre station with a heavy lorry, carrying a load of one and a half ton, also containing 27 persons, in all three tons of load, without counting the weight of the lorry; with this it entered into Auxerre by the Porte du Temple, climbing up a long inclination of 1 in 12½, by means of the small wheels; the mean velocity, going and returning, was five miles an hour. The engine then made a trip of sixty-five miles, drawing a diligence containing fifteen persons. The time made was an average of over six and a half miles an hour. The engine weighs less than one-half ton per horse power. It has two cylinders, with reversing gear; the crankshaft communicates directly, by means of a pinion, with the axle of the driving wheels; it carries two independent pinions, so that if one of the gearings gives way the other would be ready to work. The two smaller wheels are maneuvered with the greatest ease by means of a lever moved by a screw, and are set in motion by a gait-chain. These wheels are the additional "horses" put on, when necessary, to climb up or descend steep inclines or bad roads.

THE NEW PLAN FOR STREET RAILWAYS. The following notice of a plan which we have already alluded to, is from the *London Mining Journal*: The report of the engineers of Paris upon Mr. Eastman's system, made by order of the Prefect of the Seine, is most satisfactory, the result being that they proposed to establish, at the expense of the city, and with the concurrence of the inventor, a double track of his new system on the quays of the left bank, from the Bridge du Carrousel to the Champ de Mars. Mr. Eastman's rails have a concave form, the segment of the circle that represents their concavity being four English inches, and half an inch at its greatest depth. Any carriage having the breadth of track of the rails can run in their grooves, or pass in or out or across them without difficulty. The breadth of these grooves is too small to allow the feet of the horses to be entangled, or catch in them, and their depth is so slight that the wheels can easily turn out. The rails are strengthened beneath by a flange, which holds them in place, and gives them firmness. They are kept constantly free from obstruction by a broom (or plow) fixed to the carriages in front of the wheels. Their cost is less than that of ordinary rails (as they may be made lighter, and their position is beneath the surface, and not subject to side strains). Cast iron may sometimes be substituted. The carriages of Mr. Eastman's system have wheels with a convex edge, of a smaller radius than that of the concavity of the rails. The friction surface is thus very small, and the friction much reduced. The axles are united by connecting rods, that so act upon each other as to place themselves always exactly in the curves (or the axles on the radiating lines from the center of the circle) that is described by the wheels. The hind wheels thus follow exactly the tracks of the front wheels, and the carriages will turn with facility and safety in curves of a very small radius. The carriages may also run on any other road as well as ordinary carriages. They have their bodies very near the ground, so that persons may get in and out without difficulty. The carriages are also spacious, light and comfortable.

FITTING BOILER TUBES.—Improvements in the mode of fitting the tubes in the flues of steam boilers, have been introduced by Messrs. Wood, of Sheffield. In placing cross or diagonal tubes in the flues of steam boilers, great difficulty is experienced, more particularly when the flues are finished and fixed in the boilers; and it is often found absolutely impossible to take them out whole, or to put new ones in, without taking out the flues, or otherwise using packings to make up the length of the diagonal tubes, which method entails difficulty in making the ends of the diagonal tubes tight. By the system described by Messrs. Wood, the difficulties may be obviated; as the diagonal tubes may be readily fixed in the flue or fire-box of any boiler, whether vertical or otherwise. It is proposed to make the diagonal tubes with a flange at each end, in one and the same piece with the tubes,—both the said flanges to be attached to the flue or fire box of the boiler inside; also, to make the flanged ends of the diagonal tubes at an oblique angle to the center line, so that when the tube is fixed in position, the said diagonal tubes will not be at right angles to the center line of the flue.

TESTING STEAM BOILERS.—Prof. Robinson, of the University of Michigan, gives the following simple method:—Let the boiler be filled entirely full of cold water, even to the throttle and safety-valves, and all closed tight to prevent any escape. Now, by lighting a fire under the boiler, the water will be gradually expanded, and produce a pressure sufficient even to rupture the iron before the temperature of the water arrives at the boiling point. While the pressure is increasing, let the steam-gauge or pressure-indicator be watched; and when the test pressure, which may be twice as great as the working pressure,—or even more,—is reached, a portion of the water may be allowed to escape, and the pressure reduced. The pressure results from the fact that water is expanded more than iron by heat. The process is attended with as perfect safety as the use of the hydrostatic press,—unless the water be heated above 212°, which would not be required unless the boiler leaks. Below this temperature no disastrous consequences would follow, even if the boiler should be torn asunder;—inasmuch as explosions result from the sudden expansion of gases or vapors.

MACHINERY IN ITALY.—From the editorial correspondence of the *Scientific American*, dated Naples, January 28th, we extract the following:—"There still exists in Italy a strong prejudice against the introduction of labor-saving machinery. Mechanics here cherish the crude old notion that machinery would destroy the value of their labor, instead of enhancing its dignity and increasing its demands; therefore they are content to plod on day after day, through weary manipulations, which could be performed much more profitably by a machine. I was informed by an American residing in Florence, that it would not be safe for any one to introduce a circular saw, therefore boards and all other pieces of lumber are ripped by an old-fashioned slitting saw, worked by two men. Of modern agricultural machinery little or none is employed, and all attempts to improve the quality of the silk-worm have failed mainly through the opposition of those who insist upon carrying on the operations of the worm in their own houses. I cannot conceive of a better and more humane service to be done for the advancement of the working classes of Italy, than to instruct them in the proper use of improved tools and processes, and to convince them that great benefits would result therefrom."

BLOWING OUT A BEAST FURNACE.—It is occasionally necessary to blow out a furnace, but not an easy matter in doing so, to preserve its internal fire-brick lining, and at the same time to prevent the adhering of slags and iron to that brick work. A plan which has been resorted to in Prussia, consists in charging the furnace first with coke, and then with limestone instead of ore, and absorbing the heat evolved in the lower strata by the combustion of the coke in the process of burning the limestone. The plan works admirably.

Scientific Miscellany.

PROPERTIES OF ALUMINUM.—Dr. Henry Wurtz of New York has discovered that aluminum will absorb mercury, as lead does; and that in this condition it will oxidize so rapidly as to glow and burn the hand. Aluminum foil rubbed into quicksilver, on exposure to common air takes fire, and is rapidly consumed, the resulting product being hydrate of alumina. This oxide is a feathery mass, and is deposited, in the form of a coating on the foil, so rapidly that its increase is visible to the naked eye. Aluminum has so strong an affinity for oxygen that it has been found extremely difficult to separate the metal from common clay, which is nearly pure silicate of alumina; but when once separated aluminum does not readily unite with oxygen. It does not easily tarnish in air, and will not decompose water. Being a good conductor of heat and electricity, the essential conditions for rapid combustion do not occur, but when the pores of the metal have been filled with mercury, the particles of aluminum in a separate state cannot resist the attack of the oxygen in common air, and the accumulated heat generated by the rapid oxidation of the surface is soon high enough to insure the oxidation of the inner portion of the metal, which, it is supposed, the mercury has not reached. Dr. Wurtz does not thus account for the phenomenon; he believes quicksilver produces an allotropic modification of the metal by which it is brought from a passive into an active state; and suggests that it is possible to reverse this action in the case of elements which are easily oxidized, so that strong electro-positive metals, like sodium and potassium, by being brought into a passive condition, could be handled and exposed to common air without danger. He concludes that ordinary aluminum is in a passive state resembling that of iron, which, when in contact with platinum, resists the action of nitric acid; and he maintains that iron may be permanently held in that condition.

THE MAGNETIC NEEDLE IN VOLCANIC DISTRICTS.—M. Janssen who has been exploring the Santorin region, says that the magnetic needle may be employed to detect disturbances which take place at such a depth that they are not recognizable by the ordinary methods. His observations at Santorin show that there is a powerful magnetic influence in the direction of the volcanic lines marked out by M. Fouqué. He found the magnetic needle to dip much less in those parts beyond the volcanic region than in others. He recommends that the Government require magnetic observations to be made during surveys, etc.; as he says they afford a means of sounding the depth of solid strata, and possibly of anticipating earthquakes.

BLOWPIPE REACTION OF MANGANESE AND CHLORATE OF POTASSA.—The *Chemical News* says that if chlorate of potash be heated by means of a blowpipe, in a tube closed at one end, till oxygen is evolved, and then a trace of manganese added, the potash-salt will assume a purple color, owing to the production of permanganate of potash. This reaction of manganese is quite as delicate as the one proposed by Berzelius.

ACTINIC AND LUMINOUS RAYS.—During the lunar eclipse in September last, a certain portion of the moon which is visible with the telescope, was not shown by the photograph taken. Mr. De la Rue expresses this by saying that more of the moon is eclipsed chemically than is eclipsed optically.

NEW SENSITIVE COMPOUND.—M. Prat, who claims to have isolated fluorine, forms a fluoride of silver insoluble in water, and soluble in ammonia, from which it is precipitated by nitric acid. It is altered by light more rapidly than chloride of silver. The ordinary soluble fluoride of silver known to chemists is, according to Prat, an oxy-fluoride.

FREEZING OF WATER.—M. Moisson has discovered the interesting fact, that a powerful pressure not only retards the freezing of water, but prevents its complete solidification. The pressure opposes the tendency of the water to expand on freezing, and thus virtually lowers the point of solidification.

THE LARGEST REFRACTOR YET MADE.—Mr. Cooke of London has just completed a 25-inch object-glass. The telescope has been subjected to the usual tests in resolving celestial objects, and is pronounced optically excellent.

ESTIMATION OF LEAD BY PRECIPITATION. M. Stolba estimates lead by precipitating it in a metallic state. He treats both soluble and insoluble lead combinations with zinc in the presence of water acidulated from time to time with hydrochloric acid; the reduction is effected at the temperature of the water-bath in a platinum capsule; the lead is deposited partly on the sides of the capsule and partly on the zinc, whence it is easily dislodged. When the reduction is complete, which is easily discerned by a clean surface of the zinc remaining brilliant in the liquid, decant and wash the spongy deposit of lead with water. As pure water might dissolve small quantities of lead, M. Stolba recommends an addition of a drop of sulphuric acid. After washing, dry the lead first in a water bath then at about 200 C. Even then its exact weight cannot be ascertained because it has undergone a partial oxidation. After weighing it, the oxygen absorbed must be ascertained, which may be done by Mohr's volumetric method—namely, by treating the lead with a weak standard solution of nitric acid. Wash the dissolved oxide of lead, and add a standard alkaline solution until it begins to produce turbidity. The quantity of oxide of lead is given by the difference in the standard of the nitric acid before and after its action on the lead.—*Chemical News*.

ANOTTA.—W. Stein has examined anotta, prepared by De Vry in Java, from fresh fruit by treatment with alkaline water and sponso-saturating with sulphuric acid, and finds that it gives an acid infusion containing a bitter principle, which may be removed by charcoal, and another substance which reduces the salts of copper. About one-half of the mass is fat and the residue is soluble in caustic and carbonated alkalies. Solutions thus formed, on the addition of acids, yield impure bitum, which appears to contain nitrogen in combination, and which, either alone, or after dissolving in alkali, and adding a small quantity of ammonia, gives off the odor of musk.

SULPHUROUS ACID IN SURGERY.—A writer in the *Medical Times and Gazette* has found sulphurous acid of great service when applied to wounds, preventing the formation of pus, and promoting the speedy union of divided parts. He considers it superior in efficacy to carbolic acid, and free from the objections attending the use of the latter. Sulphurous acid has long been known as a most useful agent for checking organic decomposition and fermentation. It is used constantly in wine cellars for that purpose, and this new application of it in surgery would seem to be somewhat analogous to those which are already familiar to chemists.

ESTIMATION OF LIME IN ANALYSIS.—M. Bonssingault has communicated to the French Academy a new method of finding the quantities of lime in analysis. It consists in precipitating the lime in the state of sulphate, which is decomposed either by a Bunsen gas blowpipe, or by one of Schlösing's furnaces; the sulphuric acid being vaporized and the lime remaining pure. In several experiments on the decomposition of earthy or metallic sulphates, M. Bonssingault remarked frequent anomalies,—the quantity of the base remaining, often being less than it ought to be. The fact is not easy to account for.

SULPHURIC ACID.—A new process for the production of sulphuric acid has been patented in France by MM. Tardani and De Susini. Its great recommendation is that it dispenses with the large leaden chambers. The sulphur or pyrites is burned in compressed air, and the sulphurous acid is first washed to free it from arsenic, etc., and is then brought into contact with the nitric vapor in a small leaden chamber of peculiar construction.

TIERS-ARGENT.—Taloureaux first made the beautiful alloy of aluminum and silver which has received this name. It consists of two parts of the former to one of the latter metal. It is now made perfectly homogeneous, and is easily fabricated. Its hardness and lightness are valuable qualities in table utensils. Spoons, forks, goblets, and salvers made of this material are rapidly coming into use in Paris.

LARGE LENS.—A lens, three feet in diameter, three inches thick in the center, and weighing 212 pounds, has recently been made for Mr. Parker, of London. In its focus small quantities of the most refractory metals are quickly fused, and completely dissipated into vapor, and the usually unyielding minerals are immediately vitrified.

Narrow Gauge Railroads.

We have several times alluded to the economy connected with the construction and operation of narrow gauge railways for mountain travel—more especially as feeders for main routes. Such roads have been used for many years in Sweden, and are also used to some extent in the mining regions of Great Britain. They are sometimes operated by locomotives, at others by horse-power. We have been permitted to make the following extracts from the note book of Mr. Attwood, M. E., giving some interesting facts with regard to a narrow gauge railway in use at Festiniog, North Wales, G. B.; which road is used for passengers. This road has a 2-foot gauge, with sharp curves, and is operated by locomotive engines. We quote:

"The difference in level between the terminus at Portmadoc and the mountain terminus at Dinas, is 700 feet, and the average gradient for 12½ miles, from that mountain terminus to the Trêth Mawr embankment near Portmadoc, is 1 in 92. The steepest gradient on the portion now used for passengers, is one in seventy-nine, and the steepest on which locomotive engines are employed, is one in sixty. Some of the curves are exceedingly sharp, having radii varying respectively from two chains to four chains. The maximum spur elevation allowed for the outer rail, on a curve of two chains, is 2½ inches for a speed of eight miles per hour.

The engines, though on a much smaller scale, are of a somewhat similar pattern to those which have been found so useful by contractors. The wheels are four in number, and are coupled together five feet apart, and are two feet in diameter. The cylinders which are placed outside the framing, are eight inches in diameter, with a length of stroke of twelve inches, and are only six inches above the rails. The maximum working pressure of steam, is 200 lbs. to the square inch. Water is carried in tanks surrounding the boilers, and coal in small four-wheeled tenders. The heaviest of these engines weighs 7½ tons, in working order, and the cost was \$4,500 each. The average load taken up at a speed of about ten miles per hour on the ascending journey, is fifty tons, including the weights of the carriages and trucks, but exclusive of the weights of the engine and tender. In fact, the actual performance of these engines, exclusive of considerable shunting, is to convey daily, on the up journey to Portmadoc, along the Trêth Mawr embankment, average loads of 260 tons of slates; all the empty slate trucks from Portmadoc, fifty tons of goods, 100 passengers, besides parcels, at an expenditure of seventeen cwt. of coal and coke for two engines, or about 75-100 pounds per ton per mile; the average ascending gradient for 12½ miles, being one in ninety-two, and there being a level portion for about three-quarters of a mile, near Portmadoc. The high pressure at which these engines are worked, combined with the small driving wheels, gives them a surprising amount of power for the size, and adapts them well for convenience in starting, and working at low speeds. The passenger carriages are necessarily of a different construction from those in ordinary use on railways, and are also low. Their dimensions are six feet six inches high in the middle above the rails, ten feet long, and six feet three inches wide, outside measurement. Each carriage has four wheels, one foot six inches in diameter, and four feet apart from center to center of axles. There is a longitudinal partition down the center, and the passengers sit back to back so as to avoid an overhanging weight outside the rails. The second and third class carriages cost \$500 each, and do not differ from the first class, except in the fittings, which cost \$600 each. The springs are volute, and the axle-boxes, which are under the seats, are easily lubricated on the removal of a small door opposite to them. The couplings are central, similar to the screw couplings in common use, are fifteen inches above the rails, and work upon volute springs. The buffers are also central, are 4½ inches above the couplings, and work against a curved spring two feet long.

The permanent way is now laid with rails weighing thirty pounds to the lineal yard, (or ten pounds to the foot,) and in lengths of eighteen feet and twenty-one feet. The rails are supported in cast iron chairs, which weigh thirteen pounds at the joints, and ten pounds each in the intermediate spaces. The sleepers are of larch timber, four feet six inches long, and

averaging ten inches by five inches. They are placed one foot six inches apart on each side of the joints of the rails, and two feet eight inches apart on the intermediate spaces.

MINERAL LAND TITLE.—The following official letter settles an interesting question in relation to this subject:

DEPARTMENT OF THE INTERIOR,
WASHINGTON, D. C., Jan. 31, 1868.
A. P. K. Safford, Esq., Surveyor General,
Nevada.—Sir:—In reply to your letter of the 7th inst., inquiring whether a person relocating an abandoned mine can receive the benefit of the \$1,000 of improvements made by a prior locator, in making application for a patent under the act of July 26, 1866, I have to state that the improvements placed upon a lot or tract of government land by a person who subsequently abandons the same, inure to the benefit of the next settler or occupant, whether the lands be mineral or agricultural, unless such improvements were removed by the prior occupant before the premises were relocated or reoccupied. But whether a relocater of an abandoned mine can make the improvements of a prior occupant the basis of his application for a patent under the second section of the act of July 26, 1866, is an entirely different question.

Such applicant is required to show that he has previously occupied and improved the vein or lode according to the local customs or rules of miners in the district where the same is situated, and that he has expended in actual labor and improvements thereon, an amount of not less than \$1,000.

To patent the mining lands to non-residents or other persons manifesting no intention to improve them or develop their mineral resources, would not only retard the settlement and prosperity of the new States and Territories, but would operate injuriously upon the general welfare. Hence the policy of the law in requiring reasonable evidence of intention to improve and develop the mine on the part of the applicant before investing him with an exclusive ownership to the same. Would such intention be evidenced by merely appropriating the labor and expenditures of another? It is believed not, and that such improvements would not bring the applicant within the spirit and intention of the law referred to. As the information has been requested, it is supposed, to assist you in the performance of your own duties under the act, the rule of the office in not furnishing opinions upon hypothetical cases has in this instance been departed from. Very respectfully, your obedient servant,

JOHN S. WILSON, Commissioner.

THE WAR IN IDAHO.—In the Mining Summary of this week, it will be seen that the Ida Elmore and Golden Chariot Cos. had fortified themselves in their respective mines, for the purpose of resisting the encroachments of each other. Late dispatches state that the parties came to a fight on the 26th of March, the Golden Chariot Company charging on the Ida Elmore under ground. In the charge, J. C. Holgate, of the Golden Chariot was killed, and Meyer Frank, of the Ida Elmore, was mortally wounded, and has since died. It appears that three companies are working the same ledge at different points—the New York, Ida Elmore and Golden Chariot—and that the partition wall between the Ida Elmore and Golden Chariot having been lately cut through, the fact was made apparent that such was the case. Each party determined not to be ousted, hence the fight. The ledge is undoubtedly one of the richest in Owyhee, and has already turned out considerable hullion. What the final result will be, can only be conjectured, but it is apparent that more blood will be shed before it is ended, as both parties have positions well fortified within gunshot of the two mines, with fifty men armed to the teeth on each side.

Since writing the above, the dispatches state that it is probable that the two parties will come to an understanding without further trouble.

LARGE GUN.—The Chilean gun now being built at Pittsburgh is 22½ feet in length, being two feet longer than the famous Rodman gun at Fort Hamilton, but of the same bore,—20 inches. Its greatest diameter is 5 feet 4 inches, its least 2 feet 9 inches.

New Patents and Inventions.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

56,047.—NEW STAMP MILL.—Alex. Herdlein, Egan Canon, Nevada:

What I claim is, 1st, the double-armed lever F, in combination with the stampers E, and cranks, or their equivalent devices, on the driving shaft C, conducted and operated as described.

2d. The hinged tappets, i, in combination with the adjustable heads C, levers F and stampers E, constructed and operating substantially as and for the purpose described and set forth.

This invention consists in a novel mode of elevating the stamps, which is done by double-armed levers instead of the common lever, or by an ordinary cam attached to a revolving shaft. The long arms of these levers are about five times longer than their short arms. They are arranged in combination with the stamps, and with suitable works or eccentrics on the driving shaft, in such a manner that with the assistance of the double-armed levers, the operation of raising the stamper is greatly facilitated, and the number of blows of each stamper can be increased to almost any desired number per minute, without danger of having the levers come in contact with the descending tappets. The lift upon the stamper is very direct, but little friction being produced. The levers hold the stamps and disengage therefrom by a very ingenious arrangement, much resembling that which lifts the hammer of a pile-driver. The long end of the levers connect by suitable rods with cranks or eccentrics on the driving shaft. The model can be seen at this office.

75,254.—IMPROVEMENT IN BOAT-DETACHING BLOCKS.—Nelson B. Adams, San Francisco, Cal.:

What I claim is, in combination with a block, the jaws EE, with the long arms FF, the short levers HH, with shoulders an, forming a knee-joint, the operating-lever J, having its fulcrum at G, and pivoted to the knee-joint I, the whole constructed, combined, and operating as a detaching apparatus, substantially as and for the purposes herein described.

This invention relates to that class of mechanism known as boat-detaching apparatus; and consists, first, in an improved device for detaching; and, secondly, in so combining it with the block as to make it applicable to any apparatus in which it is necessary to detach promptly. The detaching apparatus at both ends of the boat is so arranged that levers may be operated either at the word of command, by two men; or they may be so connected as to be both moved simultaneously by one man, and a boat thus safely lowered from the davits,—even when under headway at sea, in either smooth or rough water.

RECENT INVENTIONS.

A BOOT STRETCHER.—Perry Veitch, of this city, has invented what he calls a boot stretcher, the object of which is to stretch a hoot in any desired part, so as to accommodate an unusually shaped foot, or one which may be afflicted with tender parts, with corns, etc., without exerting pressure on the shank which tends to break it down or throw it unnecessarily out of shape. This object is accomplished by constructing a last in two sections, divided midway between the toe and instep. The two sections are separated or drawn together by a set screw; a false instep is also operated similarly. The toe of the last is covered with a piece of metal, which, as well as the false instep, is pierced with holes into which the stems of huttons or rounded metal pieces are placed in order to stretch any part of the boot to accommodate corns, etc. The invention must prove a very useful one, as by constructing the last in this manner the shape of the boot is retained, while the tender portions of the foot are accommodated, and an easy and perfect fitting boot is the result. While by the old method of inserting a common last and "stuffing up" the part desired to be enlarged and rubbing and pounding in order to enlarge any particular part, the entire shape and contour of the boot is destroyed, causing it in a short time to spread out, and look unshapely, and per-

haps "run down at the heel," owing to the breaking down of the counters.

DRY CULTIVATOR—IMPORTANT AGRICULTURAL INVENTION.—Messrs. Webster Bros., of Stockton, are interested in and have the control of a new invention, application for a patent on which is now pending at Washington, and which has been especially devised for breaking up and preparing *dry adobe soil*. It is confidently expected that this will prove a very important agricultural invention; as by its use farmers in California who occupy naturally dry adobe land, will be able to cultivate it almost as readily as when it has been properly prepared by natural moisture. Good crops may also be secured in seasons of drought, which so frequently occur in this State, and during which it has heretofore been found absolutely impracticable to cultivate much land, that in ordinary seasons readily yields to the common plow. We expect soon to be able to illustrate this invention and describe it in full to our readers. In the meantime, Webster Bros. will furnish any information which may be desired by those interested.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

ISLAIS CREEK NAVIGATION Co.—March 28th. Capital stock, \$2,000,000; 20,000 shares, \$100 each. Trustees: Henry E. Green, John W. Shaw, Samuel Crim, John Treat and Levi P. Peck.

WOMEN'S COÖPERATIVE Co.—March 28th. Capital stock, \$30,000; 3,000 shares, \$10 each. Trustees: Mrs. B. C. Whitin, Mrs. J. R. Brandon, Mrs. R. B. Swain, Mrs. E. K. Howes, Mrs. E. T. Schenck, Mrs. W. W. Stow, Mrs. B. E. Babcock, Mrs. W. M. Smith, Mrs. W. Wright, Mrs. J. A. Drinkhouse, Mrs. E. Burke, Mrs. J. Lightner, Mrs. T. N. Machin, Mrs. R. B. Clements and Mrs. D. Wooster.

SAN FRANCISCO STAMM, 'No. 83, UNITED ORDER OF REDMEN.—April 2d. Trustees: H. A. Siegfried, S. Kellner and A. B. Lewis.

OAKLAND WATER FRONT Co.—April 2d. Capital stock, \$3,000,000; 50,000 shares, \$100 each. Trustees: Edward R. Carpenter, Lloyd Tevis, Horace W. Carpenter, Samuel Merritt, John B. Felton and Leland Stanford.

DISEASES OF THE EYE.—During a late visit to San Francisco, we fell in with an old acquaintance from this county, Mr. G. W. Purdy, who formerly resided at Forrest City. About two years ago, while under treatment, we saw Mr. Purdy at the office of an oculist in that city, with eyes badly inflamed and the sight entirely lost. We saw him a few months later at another physician's, but his case was scarcely improved, and seemingly hopeless. His eyes have now entirely recovered, so that he goes about his ordinary business. From his own lips we learned that the restoration of his sight was entirely due to Dr. D. R. Morgan, whose office is at No. 627 Sacramento street, between Montgomery and Kearny, who cured him in the short space of eighteen weeks. Mr. Purdy mentioned several remarkable cures which occurred in the practice of Dr. Morgan during the time he was under treatment, among which was that of Mrs. Jane Albert, of Brownsville, Yuba County, and several others. Mrs. Albert had been afflicted with sore eyes from early childhood, and for eleven months previous to treatment she had not been able to discern light, nor had she seen the features of her youngest child, twelve months old. She had heard of the remarkable cure of Leonard P. Elder, of Marysville, and Joseph E. Haskell, of Sacramento, and determined to try Dr. Morgan. The result was that she was able, after ten days, to read ordinary newspaper print. Mr. Purdy was of course greatly rejoiced at the recovery of his sight, after so many trials and failures with different physicians.

The above is clipped from the *Mountain Messenger*, of February, 1868. 10v16 3m

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DRS. BEERS & JESSUP, corner of Montgomery and Sutter streets, over Tucker's Jewelry Store, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14-1f

Miners, Visitors to mining districts, R. R. EMPLOYEES, and TRAVELERS generally, should insure against all Accidents in the Traveler's Life and Accident Insurance Company of Hartford before leaving the city.

WM. MACDONALD & CO., Gen'l Agents,
7v15 3p 121 Montgomery St., opp. Occidental Hotel.

Accidents.

The Traveler's Insurance Company, of Hartford, Ct., insures against death or disabling injury by accidents; \$3 to \$50 per week paid the assured in case of injury preventing the prosecution of his business; \$500 to \$10,000 paid to his family, or legal representative, in case of his death by accident. No medical examination required. WM. MACDONALD & CO., Gen'l Agents,
121 Montgomery st., San Francisco,
Opposite Occidental Hotel.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, SATURDAY MORNING,
April 4, 1886.

CITY STOCKS.

Since our last reference, there has been a considerable improvement in city shares. Spring Valley Water advanced to \$65, closing at \$64. The usual dividend is payable on the 10th. California Steam Navigation stock rose to 72@71½ per cent. Merchants' Mutual Marine Ins. Company will disburse a dividend of one per cent. on its capital stock on the 10th instant. North Beach and Mission Railroad paid the first dividend (½ per cent.) in six months on the 1st inst. National Insurance was in the market at \$71.

MINING SHARE MARKET.

During the week the mining share market maintained the marked activity noted for some time, and the excitement consequent upon the rapid rise of the various descriptions of stock has been intense. A heavy business has been done for Virginia account, and orders from the East and elsewhere come to hand quite freely. The increasing volume of business done during the first three months of the present year attest the growing importance of our Stock Exchange.

Mining and milling operations, after considerable interruption during the winter months, in consequence of the bad condition of the roads and the inclement weather, have been generally resumed in the vicinity of the Comstock lode. Indeed, a very general activity prevails throughout that entire district—the work of exploration and extraction, while being pushed with considerable vigor on the mother lode, have also been extended to quite a number of outside mines, some of them lying several miles away from it. Thus we find the Sacramento mine, situated on Cedar Hill—a high eminence one and a half miles north-west of Virginia City—extensively developed and profitably worked some five or six years ago, having lately become the property of the California Bank, has been reopened, and is to be worked systematically and vigorously hereafter, a contract tract having been let for the extraction of a large quantity of ore. Numerous other lodes in this hill, several of which have been efficiently explored to demonstrate their value, will also be reopened and worked the coming summer. The Occidental mine, lying more than a mile to the east of the main Comstock lode, has now been worked steadily for more than a year, with results nearly as good as have been obtained from the average Comstock ores. The Lady Bryan, situated nearly four miles east of the Comstock, has also for several months past been turning out ore of about two-thirds the value of that from the Gould & Curry mine; while work is about to be resumed on many of the small but rich auriferous veins about Devil's Gate and at other points along the belt of country lying between Virginia and Carson river.

Many of these mines were opened at an early day, attempts having been made to work their ores, but the great cost of reduction at that time absorbing all the product, caused them to be afterwards abandoned. At present rates, however, many of them can no doubt be made to pay well, thereby opening a new field for labor and adding materially to the bullion product of the district.

As the quartz in the lodes on Cedar Hill and in the Devil's Gate district contains but little silver, it is worked for the gold alone, the apparatus and methods employed in working it being those used in the quartz mills of California, the cost of which is much less than where pan amalgamation is resorted to.

In the mines along the Comstock lode proper, there have been no important changes to note during the last quarter, other than such as have marked its develop-

ment from the first, and as may be expected to occur in all masterly veins. The yield of bullion from the productive portion of this lode has for the quarter just ended been about equal to that of corresponding periods in other years, having been considerably curtailed, as is the case in all extremely inclement winters, in consequence of the bad condition of the roads and the stormy weather.

IMPERIAL—has been somewhat more active under better prices, rising from \$263 to \$295, receding to \$270, and closing at \$277.50.

All work upon the Imperial-Empire shaft and the progress of the drifts from the lower level are now watched with great interest by the speculator in stocks that will be effected by the development through this large and well constructed work. At latest dates the drift had been carried in upwards of forty feet from the 900 level, and on the evening of the 30th ult. the separate drift for the vein was commenced. The bullion receipts for March foot up \$39,761.15, with another clean-up to hear from.

SAVAGE—has been unusually active for some time past, and during the past week advanced to \$173.50, receded to \$167, then sold at \$173@167.50, and closed at \$171. During the week ending March 28th, 1,683 tons were extracted, valued at \$36.32 per ton, against 1,095 tons, valued at \$34.27, extracted in the previous week. The north mine on the third station yielded 967 tons against 603 the previous week.

CROWN POINT—advanced from \$2,200 to \$2,340, declined to \$2,010, and at the close sold at \$2,120. Telegraphic advices state that the drift is in seventy-eight feet from the 800 station, and nineteen feet west of the winze from the 700 level, which is now ninety-five feet in depth. This winze is not running in as good ore at present as previously reported. The faces of all the flows going south on the 700 level are looking well.

KENTUCK—has been less active than usual, advancing from \$422.50 to \$435, then selling at \$400, and closing yesterday at \$420. We understand that this mine is looking well throughout, and the prospects for continuous dividends for months to come are very fair. The shaft is about being carried to a further depth of 400 feet. At present the yield is about seventy-five tons per day, which is said to average from \$45 to \$55 per ton. For March account the bullion receipts add up \$47,600.

CHOLLAR-POTOSI—was in request at an advance, rising from \$215 to \$277, and closing at \$268. For week ending March 26th, the ore product amounted to 238 tons, against 249½ the previous week.

HALE & NORCROSS—sold to a moderate extent at \$2,350@2,550, rose to \$2,760, and at the close sold at \$2,700.

AMADOR—sold to a limited extent, realizing \$305. It is reported that a dividend of \$12 per share is likely to be disbursed on Monday, the 6th instant. The receipts of bullion in March aggregate nearly \$53,000.

LADY BRYAN—sold to a large extent during the period under review, rapidly advancing from \$23 to \$48, and closing at \$46. The bullion product for March is about \$20,000, the ore yielding about \$25 to the ton. Good ore is found on the 200 level, and the prospects seem to be very fair.

OVERMAN—increased in activity toward the close of the week, opening at \$181, rising to \$230, and closing at \$225. Since our last report, bullion amounting to \$14,670 has been received at the office in this city.

GOULD & CURRY—advanced from \$630 to \$680, declined to \$650, and closed at \$640. YELLOW JACKET improved to \$1,510, dropped to \$1,400, and at the close realized \$1,410. BELCHER rose from \$365 to \$400, receded to \$387.50, and closed at \$380.

BULLION was in marked request, rapidly rising from \$80 to \$160, dropping to \$85, improving to \$112, and closing at \$105. Work was resumed in the lower drifts on the first instant. ALFA also took a rapid upward stride from \$84 to \$105, then sold at \$90, and closed at \$92.50. EXOQUEER sold largely at enhanced rates, opening at \$52, jumping to \$95, declining to \$70, and at the close selling at \$82.

DANEY—sold to a larger amount than usual, within a range of \$28@19, closing at \$21. An assessment of \$3 per share, or \$12 per foot, was levied on this stock on the 2d instant. GOLD HILL QUARTZ rose from \$95 to \$130, closing at \$127. The ore reduced for March account amounted to 426 tons, showing a yield of \$8,166. EMPIRE advanced to \$325, closing at \$320.

OPHIUM—was in better request, advancing from \$225 to \$275, then selling at \$239, and at the close realizing \$270. SEGREGATED BELCHER was largely dealt in, rising from \$19.50 to \$29, and closing at \$28. SIERRA NEVADA also showed increased activity, selling within a range of \$24@32, and closing at \$26. CONFIDENCE, inactive for some months, came into the market quite freely, rising from \$80 to \$130, and closing at \$110. CONSOLIDATED GOLD HILL M. Co. came into market yesterday morning, selling at \$40, but in the afternoon \$150 was bid. UNITED STATES was also placed on the market, selling at \$23. These mines are located in the Gold Hill District, on the Comstock lode.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleville *Miner*, March 21st: About 28 ft. have been added to the lateral tunnel of the Monitor Co. during the past week.

The tunnel of the Pennsylvania Co. is in softer rock than usual, and more water is encountered.

A shaft 160 ft. long, 4x4, has been run to the open air from the tunnel of the Levathan Co.

Genuine black ore has been struck in the lower level of the Morning Star mine, similar to that found in the palmy days of the upper level.

Chronicle, March 21st: The Pittsburg Co. in Scandinavian Cañon, have struck a ledge 300 ft. from the mouth of the tunnel which shows good silver-bearing quartz.

The late storm necessitated a cessation of work in the Rippon tunnel, an avalanche and the drifting snow, carrying away the outside works and covering the mouth of the tunnel.

Amador County.

Ledger, March 28th: The last fortnight's clean up at the Oneida mill, fully met the expectation of its owners. During the run but two-thirds of the stamps were kept in operation, and the gross product of the gold was over \$10,000. Now that there is a prospect of good weather, work will be pushed more vigorously than ever before.

For some days, Messrs. Tripp, Skinner and two Chicanos have been working a vein of rock in French Gulch, south of Butte Mountain, and Tuesday last sent us a sample of the metal they obtain, which upon examination, was pronounced to be silver. We took the button sent us to Mr. Reichling, assayer in this place, and after a thorough test, it proved to be silver, with a very small quantity of gold contained in it. The button weighed, before assaying, 17 grains, and was the production of one ounce of the rock. In assaying it lost two grains—leaving its weight 15 grains. At this rate the rock will yield over \$1,200 to the ton. The ledge at present, is six ft. in width.

The Casco mine, better known as the Old Marlette claim, having passed into the hands of parties in San Francisco, is being worked vigorously and systematically. They have now reached a depth of 200 ft., run a level south 100 ft., and are taking out large quantities of good rock. The ledge here is about 7 ft. wide. The company have an 8-stamp water mill which is run at a trifling cost, thus enabling them to prospect the rock at a small cost.

The late unparalleled rains have greatly impeded quartz mining and entirely suspended work on some mines. The weather seems now settled, though some weeks will elapse before the surplus supply of water drains off sufficiently for advantageous working.

Dispatch, March 28th: Mr. White, an Italian who resides this side of Pine Grove on the New York Ranch road, has struck a rich placer mine in his garden, from which he has realized from \$10 to \$20 per day to the hand.

The company owning the Casco mine have contracted to have 1,000 tons of quartz hauled to their mill on the Mokelumne river, about one mile from their mine, at the rate of 50 cts. per ton.

Butte County.

Record, March 28th: We understand parties from below have purchased the Jordan mill and mine, for the sum of \$10,000. This mine is situated some six miles above Yankee Hill, and has heretofore yielded well. The purchaser is making preparations to work it in a thorough manner, and there is no doubt but that it will result profitably.

Calaveras County.

Chronicle, March 28th: Under the exhilarating influence of the pleasant weather we are now enjoying, miners have again commenced work upon their claims with energy. New and extensive operations in quartz are being inaugurated, and the coming season promises to be livelier than for several years preceding. The success which has attended the opening of the lode in Rich Gulch is having a very beneficial effect, giving encouragement to others to persevere. Gravel mining, in Chili Gulch, is being very successfully prosecuted. Brackett & Co. are erecting a mill on their claim for the purpose of crushing the cement, it being found impossible to extract the gold by the simple process of washing. They will be ready to commence operations in the course of two or three weeks. Messrs. Shaw, Albright, Ahnrot & Co. are hydraulic with good success. Stockton ridge is melting away before their combined

efforts like snow before the sun. Paul & Co., Martin & Co., Harkins & Co. are also busily engaged in taking out the shining ore. The Golden Gate Mining Co., we are informed, are getting excellent pay.

San Andreas *Register*, March 28th: We were shown, recently, some exceedingly rich quartz from the Ben Thorn claim. It resembles the rock from the far-famed Hayward mine of Amador, so closely that those who claim to be good judges pronounce it almost impossible to distinguish between the rock. It seems to be generally conceded that the Thorn claim is a perfect success, and that the extensions are equally as good. Tait and Gregory, on the south of Thorn, seem determined to push labor on their extension as soon as it is practicable; and the Mexicans, on the north, seem as equally bent on following the vein down. We have heard some talk of the erection of water-power arastras for working the rock from the lead.

In the meantime the claim of Captain Thorpe is yielding regularly good wages. He has kept his arastras in motion all the winter. The claim pays well, is easy of access and readily worked. We understand that he has had several offers for the mine from San Francisco capitalists.

The vein, running through what is called the Talaferro Hill, on the northeast side of the town, is to be worked this summer.

Quartz prospectors report rich indications in various directions around the town. A great many new leads will be worked in this vicinity this summer.

From every direction throughout our county the news and reports indicate prosperity; and the miners seem to be settling down to the conclusion that quartz claims will pay them for their labor, and that they are easily found and readily worked in old Calaveras.

Inyo County.

Virginia Enterprise, March 21st: We hear very good reports from Cerro Gordo. It appears that notwithstanding the severe winter, one or two furnaces have been kept constantly in operation. Some of the ore smelted has yielded as high as \$1,000 per ton. All interested in that district have the utmost confidence in the richness and permanence of the mines. They believe in the many ledge theory, and say they have a big rope fastened to a convenient tree in the camp with which they will hang the first man who "talks one ledge" to them. They expect, when they get their furnaces in operation this summer, to take out many tons of silver.

Kern County.

Havilah Courier, March 21st: The St. John mine, at a clean up some weeks since, obtained \$7,500 after a two weeks' run. The company obtained \$9,000 at the last clean up, after a fortnight's run. Hammel & Deuker are going to work energetically to develop the Burning Moscow. It prospects well. George Leeper has discovered a very rich lead in New El Dorado District. Operations are to be resumed by the Alpine Company on the Greenhorn mountain. Work will soon be commenced again on the Long Tom mine, under the superintendence of Joseph Woodworth, a veteran miner. Ellsworth's & DeLand's machinery has arrived. It is to be used working mines at Kernville.

Visalia Delta, March 25th: At Kernville, in Kern county, the principal mine is owned by two companies, Hutton & Co. and Ellsworth & De Land, which mine, prior to the great freshet, was yielding an average of \$25,000 per month; but owing to their mine being filled with surface water, they were compelled to suspend operations to a considerable extent, until such time as they can set their new steam hoisting works in operation, which will be completed about the first of April. At Saealand, Messrs. Taylor & Co. are doing an enormous business in the way of turning out bullion. J. R. Rodgers & Co. will also have a 20-stamp mill running in Sageland within the next thirty or forty days, when, it is confidently asserted, that those two mills of 30 stamps will produce more bullion than 100 stamps in any other district in the county.

Mariposa County.

Mail, March 23d: Mr. Phillips, at the Buchanan copper mine, is still pushing forward his enterprise, and is determined that his investments at that place shall not be a failure. He has a vast quantity of fine ore on hand, but in the present condition of the roads it is utterly impossible to ship it below. As soon as the roads are passable for teams, Mr. Phillips will ship a large amount of ore to some landing on the San Joaquin, where it will be sent by steamer to San Francisco.

Gazette, March 27th: The operation of pumping out the Washington mine, near Hornitos, has commenced. It is calculated

that about seven days will be required to finish it, then the crushing of the quartz will commence.

Nevada County.

Transcript, March 22d: The few days of pleasant weather have aroused the miners, and many claims will soon be in operation in localities where the snow is not deep enough to prevent them. Above the snow line, miners are only waiting for an opportunity to start in, and enterprises will be pushed forward with all vigor. The deep snows in the mountains will give the miners abundance of water, and many companies will be able to keep at work until late in the fall.

The Idaho Co., whose claim is the extension of the Eureka mine, near Grass Valley, have struck a rich ledge. This Co. has been at work several years and expended about \$30,000 in prospecting.

On Friday last, John Adams picked up a specimen of quartz gold in front of the Nevada Hose house, on Main street, worth \$2.50.

March 26th: The Pittsburg mine is looking first rate. The prospects are so encouraging that the company contemplate adding five more stamps to their mill next month, when the mill will consist of 15 stamps, and be capable of reducing a ton and a half of quartz per hour.

March 27th: The Merrimac mill has been purchased by a company owning a quartz ledge at Ragan Flat, near Cement Hill. It will be removed and put in running order upon the new ground at an early day.

March 28th: The American gravel claims at Sebastopol, owned by Swan & Co., are turning out "big money." After a run of twelve days the company cleaned up last week, taking out \$15,000.

Wm. M. Gwin (formerly Duke de, etc.), arrived at You Bet on Thursday last. He is looking after some mining claims in which he is interested at Chalk Bluff.

March 30th: Fred. Sennar, yesterday picked up a lump of float quartz in Wood's Ravine, which weighs about 1½ pounds, and is literally filled with rich flake gold. The corners were worn smooth by the action of water.

Grass Valley *National*, March 25th: The New York Hill Co. stopped their crushing operations a short time since for the purpose of adding additional crushing facilities. They will start up again in a few days, and with the large addition made, be enabled to crush the rock as fast as taken from their mine.

Operations will be resumed the coming week upon the Empire Co's mill and mine.

March 26th: About two years since, the croppings of a quartz ledge was struck by Mr. Rannels, while setting out some fruit trees on his lot on Winchester Hill. The rock taken out at the time was considered to be rich. Since that time, however, but little work has been done on it. A company of miners are about setting in to prospect the ledge, in which we hope they may be successful.

Gazette, March 31st: Richards & Co., owners of the mill, on Deer Creek, have just completed some extensive improvements—having almost rebuilt the mill. New batteries have been put in, in place of the old ones, and the old fashioned stamps and square wooden stems have given place to the improved and more convenient stamps and iron stems now in common use. The mill was started up yesterday, and will first crush a lot of some 200 tons from the Rising Star ledge. After completing their crushing the mill will be set at work on rock from the company's ledge—the Ural—which will supply enough to keep it in constant operation.

Parties interested in the mining ground on the Washington Ridge, immediately northeast of Nevada, and located on what is supposed to be the extension of the Nebraska channel, are taking measures to prove up the mineral character of the ground.

Grass Valley *Union*, March 29th: The Coe mine which has been lying idle for some time, is just now attracting the attention of its owners. Yesterday some beautifully rich rock was taken out of the old shaft, which created quite a stir of excitement in mining circles.

The Inkerman ledge, supposed to be an extension of the celebrated North Star lead, has been in course of prospecting for some time past. A crushing was had the other day from this ledge, and from the croppings ten loads of rock yielded \$100, or \$10 per load. Rock taken from the bottom of the shaft, 60 ft. in depth, yielded \$15 per ton in the crushing.

EXCELSIOR.—Grass Valley *National*, March 28th: The Meadow Lake denizens are luxuriating under a weight of 20 ft. of pure, spotless snow, and calculate to get a sight at the sun some time in the coming May.

Placer County.

Shirt Tail Cañon, so famed in early days for its richness, but lying idle for the past 10 years, (although held by a party of 12 men), is likely soon to yield up its treasures quite equal to former times. The cañon is over 20,000 ft. long, and has been the receptacle for all the tailings from the richest hills in Placer county during all this time,—the washings from Brushy Cañon, Yankee Jims, Iowa Hill, Wisconsin and Smith's Hill, together with all the mines on that side of the Divide emptying into it, for a distance of 15 or 20 miles,—the result is that the tailings are now from 10 to 50 ft. deep, all of which are thoroughly impregnated with quicksilver, carrying more or less gold, and all ready for working, while all the water needed runs through the cañon after leaving the other claims. Thus water and quicksilver are free to work with, while for all time to come the mines above are furnishing material that must pay as long as the mines are worked.

Recently Mr. D. M. Hosmer, in connection with a few other gentlemen, have purchased the remaining interest, and are about commencing to flume the cañon and wash all the dirt. They are commencing about a mile below the lead, while preparing an immense flume at the foot of the cañon, where there is a fall of some 60 ft., with a good fall all the way up. Competent judges think that the claim will pay an average of at least \$10 per day to the land, and as the company will put on 50 men, as soon as the water permits, if the above initial estimate is correct, they will realize at least \$150,000 the coming year. There is no doubt but that the claim is among the richest gravel tailing claims in the State.

Auburn *Stars and Stripes*, March 26th: John Walgreen, the gentleman who discovered the celebrated Good Friday lead near Ophir, last fall, located a claim 110 ft. from the Good Friday, and developed a vein of quartz five inches wide and very rich in free gold. Owing to the unfavorable weather of past winter, Mr. Walgreen has only been able to get out five tons of quartz, which he had crushed at Schnabel's mill, near Newcastle. The yield was at the rate of 14½ ozs. per ton, or about \$1,200. There is more rock in the vicinity equally as good.

Jos. McLaughlin, while strolling around near Ophir, last Friday, observed a quartz boulder projecting from the ground, and out of curiosity, stooped down and pried it out. The operation disclosed a chunk of gold thickly studded with quartz, which upon being crushed in a mortar, yielded upwards of \$300.

Dutch Flat *Enquirer*, March 28th: Staple Bros. are meeting with good success in the Waukegan claim.

On Tuesday, the pipe which is used to convey water through the cuts above town burst and caused about 150 ft. of the pipe to collapse with the force of the air. It caused a temporary suspension of work in some of the claims which depended on the pipe for their supply of water.

Auburn *Herald*, March 28th: The contest between the Ophir and Good Friday Cos. has been amicably settled. The Ophir Co. pays the Good Friday \$3,500, and allows the Good Friday boys to have all the rock that is now out, supposed to contain at least \$2,000.

The Gold Run correspondent says: The miners are most of them at work—none but those interested know upon what terms.

Plumas County.

Quincy *National*, March 14th: The miners in Argentina district, are busy at work and doing well. Heath & Co. are taking out big pay in the old Bethel claims. Kniseley & Co. are running their quartz mill regularly, with good results.

The miners of Hungarian Hill have been snowed up most of the winter, and no work has been done except in the tunnels. Scurr & Hersey are running a bedrock tunnel for the purpose of prospecting a large gravel deposit. They are under ground some 330 ft., and expect to strike gravel in running 100 ft. more. Kelly, Moser & Co. will commence work in their claim as soon as the water comes in piping quantities. They have a very rich claim, and will roll out the slugs in abundance. Nick. Hartley is getting ready for action.

From Butterfly Valley, we have the following items: Maxwell, Anderson & Co. have struck diggings at this place. It seems that the lower end of Little Butterfly Valley is a gravel deposit, and with plenty of water, would profitably employ a large number of men. John Ball has about completed his ditch to this place, and will soon make some developments. Cashman & Co. have struck good prospects on High Bar opposite the mouth of Butterfly Creek. They intend to bring in the water from Plumas Creek, which puts in above Black Hawk, on the opposite side. From the prospecting that

has been done within the last few months, it is believed that most of the bars from Black Hawk down for two miles, if properly worked, will pay good wages in both coarse and fine gold. All the bars can be commanded by a ditch taken out of the river at the falls above Black Hawk. Black Hawk is still rich, and another claim is to be opened this summer.

San Bernardino County.

Guardian, March 14th: We understand the mining claims of Mr. Davis, on Lytle Creek, will hereafter be worked under the superintendence of Mr. David Bowman of Contra Costa county. Mr. Bowman is an old experienced miner, and will introduce to this locality several new and important features in placer mining, which will greatly facilitate the operation of extracting the precious ore.

Sierra County.

Downville Messenger, March 7th: The Independence Mill at Sierra Buttes was destroyed by three successive snow slides, on the 3d inst. It will require \$25,000 to put the mill in good order again.

Last Wednesday the Keystone Mill met the same fate that the Independence Mill met.

The misunderstanding between the locators and purchasers of the disputed stock in the Good Hope quartz claim has been amicably settled.

Siskiyou County.

Yreka Union, March 21st: We learn that Pool & Co. have got into the channel in their claim on the flat, and are taking out good pay. Success on the part of Pool & Co. will stimulate a great many to start in to open claims on the same flat. A new era of prosperity is about to dawn on Scott Bar.

Yuba County.

The Brown's Valley correspondent of the *Marysville Appeal* of March 24th says: In the Pennsylvania claim, incline No. 1, the lower levels 8, 9 and 10 are still under water, and any attempt to free them from it would be useless for the present, as the upper pumps can scarcely keep it down at its present level. Fortunately the upper levels 5 and 6, and incline No. 2, furnish more than the necessary supply of good quartz for the 16 stamps of the company. The company are now saving a large quantity of sulphurets, and several loads of them are ready for shipment to the Eureka Reduction Works at Grass Valley. The Rattlesnake claims also had all the water they could take care of, but it became no real impediment to the working and developing of the mine. The company are pushing on their drifts and shafts with great vigor, and seem to be in good spirits. They have now two oblique pay chimneys, about one hundred feet from each other, and will begin crushing as soon as their 10 stamps are in order. It is hoped they will be ready to crush on or before the 15th of April. The company will test this week the new Giant powder in one of their levels. In the Dannebrog claims the water also greatly interfered with the opening works of the company. Their prospects are still encouraging, and their mill will again be started within a short time. The Jefferson Co. continue to prospect, under the direction of their Supt. The Sweet Vengeance is now ready to resume work as soon as the weather will permit it.

ARIZONA.

Miner, March 7th: The Badger, is the name of a recently discovered ledge in Big Bug district.

We saw, the other day, a piece of rock from the Patanka lode, in which the veriest ignoramus could detect lots of the pure plata. This lode is situated a few hundred yards south of the Sterling lode, in Hassayampa quartz mining district. We are told that the ledge crops out for several hundred yards.

J. B. Slack, the owner of the Gross lode, informs us that it is his intention, as soon as the weather moderates in the mountains, to commence work upon the Gross, in anticipation of the running of the Bully Bueno mill, which, it is expected will be set to work in May or June. The Gross is very rich in free gold, and we sincerely hope that sulphurets will not come in for some time, at least.

The last clean up at Lewis & Winning's claim, yielded \$10 per day to the hand. A piece weighing over \$10 was recently picked up by them.

About two miles below this place, Anderson & Co. are working a bar of Big Bug Creek, and we are assured that they are making good wages.

A party of Coloradans are prospecting a long gulch that puts into the creek from the north, below the Mexican gulch, and are getting excellent prospects. They have worked through the cement.

In the vicinity of the mill, two or three

companies were at work, with what success we could not learn.

The last run made by Little & Taylor at Lower Lynx Creek, yielded over \$10 a day to the hand. We saw a lot of the gold brought to town by them (some fifteen ounces) which was nearly retorted, and looked as though it were worth over \$17 to the ounce.

Many Mexicans are working in gulches emptying into Lynx Creek, below Little & Taylor's diggings, on the south side of the creek.

Placer and quartz mining are being carried on in Walker district.

Ranchmen from Kirkland Valley inform us that in the foothills close to the creek, there are ravines that they know will pay if rightly worked. A lot of Mexicans a long time ago, worked in these gulches, and made fair wages, although they had to pack the dirt to the creek to wash it.

A party just arrived from Wickenburg give the following report concerning the mines in that vicinity: Wickenburg & Smith are working a claim on the Vulture lode, west of the Vulture Co's claim. The Wickenburg 5-stamp mill had been running for several days previous to the time the party left. A clean up was being made on Sunday morning, and at the time the party left Wickenburg, 100 ounces of gold had been secured. The rock taken out of the claim is said to be lousy with gold.

The Vulture Co's 20-stamp mill is constantly employed crushing ore, which, we are told, pays first rate.

COLORADO.

Georgetown Miner, March 12th: Garrott, Martine & Co., during the past week, made a run of 2½ tons of ore from the Wm. B. Aster lode. The yield from this ore was 498.25 ozs. of silver, worth in coin valuation, \$497.95. The assay of the crushed ore was \$215.19 per ton, and the loss from this assay was only 16 per cent. Development of the Aster lode was commenced last spring. It is situated near the summit of Republican Mountain, and a trail of considerable length had to be constructed, in order to get the ore to the mill. From the silver extracted from this and a previous run of five tons, the company owning the mine have more than paid all the costs of opening the lode, mining, packing ore and milling.

Messrs. M. B. Case and sons are opening a newly discovered lode on Republican Mountain. It is situated upon the north side of the gulch about 300 feet above the Cuckoo lode. The shaft on this new lode is down about 12 ft. and shows a crevice six feet wide between permanent walls. The mineral is sulphurets of silver, blue and green carbonates of copper with a small show of galena.

The Knickerbocker mill, at Empire, has temporarily stopped running.

A lot of Hise ore has been taken to the smelting works for reduction.

Messrs. Scott & Packard have resumed work on the east shaft of the Nuckolls lode.

We learn that Mr. Herrick will start up the smelting works the coming week.

Mr. Geo. Hickcox has made a new discovery of a silver vein, in Gilson Gulch, which bids fair to rival the famous Franklin lode. The ore assays \$400 to the ton.

The workmen in the Smith & Parmelee mine have struck a very fine vein of iron 30 in. in width and running the entire length of the company's property.

DACOTAH.

Sweetwater Mines, March 4th: It is reported that rich placer diggings have been found on the head waters of the Wind River, and also in the Big Horn mountains.

The shaft on the Atlantic lode is 70 ft. deep, and shows a crevice of 20 ft.; the ore is rich. A shaft of about ten ft. on the Austin City lode, displays a vein of 4½ ft.

On the Misouri lode is a shaft of ten ft., showing a vein of about five ft. The ore assays from \$60 to \$100 per ton. Ore from the Flora Temple lode assays \$45 to the ton; and from the Almira lode, from \$25 to \$90 per ton. The crevices are five ft. in width. On the Illinois lode is a 15 ft. shaft, and a three ft. vein; and the ore assays \$55 per ton.

IDAHO.

Owyhee Avalanche, March 14th: The parties owning the Ida Elmore and Golden Chariot mine have finally come to the conclusion "to fight it out on that line," and accordingly the fight has commenced in earnest. The partition wall between the two working parties has recently been broken through, disclosing the fact that the two mines or claims, were on one and the same lead. The combatants have fortified themselves in the slopes and drifts, and both parties seem determined to hold their "grip." The Ida Elmore party are preparing hose by which to eject hot steam and water upon their antagonists. About 40 shots were exchanged on Thursday.

The rich strike in the Oro Fino is all that fancy painted it.

In the ore house at the Golden Chariot mine, this week, we observed some of the richest ore that we have ever seen. There is both silver and gold in it in large quantities—pure native silver, held together, as it were, by leaves and threads of gold. Went down into and through the mine, and in different places therein saw ore so rich that the gold and silver could plainly be seen by the light of the candle which we carried. The mine will still continue to turn out Golden Chariot bricks.

A tunnel 150 ft. in length is now completed on the Woodstock mine. It taps the main shaft at the bottom, 75 ft. from the surface. In the north shaft the vein is over two ft. wide, and of such a character that if worked properly should pay from \$200 to \$300 per ton.

The Ida Elmore yields richer ore than ever. It is hauled to the mill as fast as it is taken out. Saw a quantity of quartz on the dump this week, all spotted with silver and in much of it gold was also discernible.

Stoping is going on between the upper and lower drifts in the Potosi mine, and ore of immense richness is being taken out, richer than was ever before found in the mine. On the dump we noticed about twenty tons of quartz, that if properly worked, should turn out quite a snug little fortune in itself. The ore contains considerable gold, but is chiefly remarkable for its richness in silver, in the form of black sulphurets. In some of it, also, can be seen pure native silver, in some instances beautifully crystallized.

World, March 14th: Mr. Geo. A. Dunn continues to work his hydraulic claim on Benum Hill, across Elk Creek, day and night, despite unfavorable weather. Active mining will soon be resumed in every mining camp in the Basin.

A correspondent of the *Montana Post*, writing from the Salmon River mines says: Claim holders are already complaining of there being a scarcity of labor in the country, the scarcity being general throughout the Basin. Offers have been made of \$7 per day with assurance of steady employment all summer, (and from the tenor of his letter we would judge that from 500 to 1,000 men can find employment in that section at wages not less than \$6 per day.—Eds. Press.)

MONTANA.

Post, March 7th: Hugh, Duncan & Co., have excellent prospects for a good summer's work. They will put in a flume and sink a shaft at the head of their drift as soon as the weather permits.

Nowlan & Weary, received per Wells, Fargo & Co's express, yesterday, from the Esler furnace at Argenta, 115 pounds of silver bullion.

The two pieces of retort from the first clean up on Atlantic Cable lode, which arrived in our city on Wednesday last, was the finest lot of lead retort which has as yet been brought to our city, or probably turned out in our Territory. The retort amounted to \$9,216.49, and assayed .942 fine. It was the result of nine days running for the 20-stamp mill recently put up on the lead by Messrs. Nowlan & Plaisted.

Quite an excitement has been created during the past week, by reports of gulch diggings eight miles from the Muscleshell. The 30-stamp mill of the Philadelphia Mining Co., and the 24-stamp mill of the I. X. L. Co. cleaned up, on Saturday last, after one week's run on rock from the Union lead. The coin value of the retort from each mill is as follows: Union mill, \$4,268.67; the I. X. L. mill \$4,475.71, making a total of \$8,744.38. The retort of the Union mill exceeded that of the I. X. L., by over 30 ounces, but the latter was about \$3 to the ounce finer.

Good prospects have been found in Rams-Horn gulch, recently, near Prof. Mape's mill. The party sinking on the claim took out ten cents to the paul the way through the gravel, which is four ft. deep. The diggings are shallow, the gulch about twelve miles long and plenty of water.

Same of March 14th: Chas. Rumley, who has just arrived from Phillipsburg, says that lively times may be expected at Flint Creek this season. He saw specimens from the Bugher-Rumley lead on exhibition at the office of Charles Sears, which eclipsed any silver bearing rock in the Territory. One brick in the store of P. H. Ren, on Bridge street, weighs 111 46-100 ounces, .957 fine, and is valued at \$137.90.

Daney's Bar, situated on the Missouri River, at the mouth of the Prickly Pear, has been partially prospected with good promise of success; as high as five cents to the pan having been obtained.

Mr. Creigh, of the Union City mills, yesterday deposited a 90-ounce brick, currency value \$2,031.55, with Messrs. Nowlan &

Weary, bankers. The pocket on the Oro Cache, from which the mill has recently been crushing, is nearly exhausted, but another pocket, apparently much larger, has been opened up, and the mine is still looking very favorable for good returns.

We notice at Nowlan & Weary's, a brick, the product of Alameda rock crushed in Mitchell's arastras, and assayed by Bohm & Aub, Helena. Its weight is 45 ounces; contains gold, \$96.74; silver, \$51.78; total, \$148.25; and is .987 fine. The result is from 8½ tons of ore.

We understand that work is to be immediately resumed on the water ditch to El Dorado Bar, and that it is the intention to have the water on the bar by the 1st of June. Some prospecting, which has recently been done on the bar, has served to raise the hopes of every one connected with the enterprise, of their ultimate and final success.

NEVADA.

Humboldt.

Unionville Register, March 14th: Gov. Fall has located the site for his new 20-stamp mill, and is now at work on the foundation. By the 15th of May, at the farthest, he will have his mill up and running.

Last week the Montezuma smelting works shipped 3,777 ounces of fine bullion. Value, \$4,800.

Same of March 21st: The Montezuma furnaces are in full blast.

The dam at the outlet of Humboldt Lake broke one day last week, overflowing the banks below. The dam was constructed by the Utica Bullion Co.

Reese River.

For some reason, to us unknown, we again find ourselves minus our usual mail from this locality.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Enterprise, March 21st: Two fine bricks of bullion from the Lady Bryan mine may be seen at the Bank of California to-day. It is only a fortnight since we called attention to a couple of similar bricks. The value of the previous lot was over \$4,100, the value of this \$4,350.

Several mining companies in this vicinity, who have done but little work for the past three years, will resume operations this spring.

We have been shown some specimens of ore taken from the Lady Bryan mine, in which much leaf silver is visible.

The Lady Bryan Co. have just made a clean up of 2,600 ounces of bullion.

March 24th: The United States Co. yesterday commenced work upon a large new shaft which is intended to develop their east ledge. They hold eight locations, of from 800 to 2,000 ft. each, in the range of the present deep workings on the Comstock. Although the ledge is broken and mixed with foreign matter, there are throughout its whole width deposits of excellent ore—ore that assays as high as \$30 per ton. They have driven a tunnel into the mountain to a distance of 2,000 ft., with a branch 100 ft. in length, and have sunk upon leads cut by the tunnel two shafts, each 100 ft. in depth. Near the extreme end of the tunnel a very fine ledge was cut from which ore has been taken that assayed as high as \$42.

March 28th: Many of our miners and prospectors, who a week or two since contemplated going to Sweetwater, have given up the idea and will remain here and prospect our numerous promising outside leads, being encouraged in such resolution by the very cheering results obtained by the Occidental, Lady Bryan, Sacramento, and other companies now working upon outside leads.

Wells, Fargo & Co. shipped from their offices in this city and Gold Hill during the past week, 6,680 pounds of assayed bullion, valued at \$214,733.79.

March 29th: The average of fine assays of ore taken from the Lady Bryan yesterday, was \$59.23. Their assays run from \$25 to nearly \$150. The mine is looking better than ever before.

Gold Hill News, March 24th: The mines of Gold Hill are looking very finely, and their future prospects particularly good. This is the reason of the present elevation in our mining stocks.

OREGON.

The Umatilla Press says that Indians bring in gold quartz there from some neighboring region, of which they will not impart information.

IMPORTANT PATENT DECISION.—A Washington telegram dated March 31st, says: The contest which has been long pending in the Patent Office between the owner of the Goodyear Hard Rubber Patent and William Mullee, has been decided in favor of Mullee. After a desperate opposition, the patent is issued to him.

San Francisco:

Saturday Morning, April 4, 1886.

Notices to Correspondents.

ONE THAT WHISTLES AT THE PLOW, Marin County.—There exists no reason for supposing that the cycles of seasonal changes have varied since the American occupation of California. It has to be borne in recollection, that the bulk of this State possesses a climate more approaching the tropical, than the arctic; we can not therefore feel surprised that in the average of years, our spring and later winter months assume a very mild character. Interruptions to this general character may, however, be expected occasionally. It is a well known fact, among many of the temperate parts of the globe in higher latitudes than this State, for example the British Isles and central Germany, that when a week or ten days of remarkably fine weather occurs during the month of March, such is invariably followed by severe weather at the commencement of April. This circumstance has in England caused the first nine days of April to be called the horrowing days, and has given rise to the allegory "that March borrowed nine days from April, which March repaid with rain, hail and snow." In Ireland the legend takes the form that April weather, like the present, belongs to the days on which "the old cow died." A similar legend exists in Germany; the saying being based on the fact, that the fine weather of March having induced the owner to turn his animals from their winter's sheltering roof, they perished during the succeeding rigid weather which commonly follows such an event, during the succeeding month.

C. H. A., Lone Pine,—writes us as follows: "In answer to the common problem of the number of equidistant posts required to pass over or through a hill, usually considered to be equal, a friend asserts that it would require more to go over the hill, because the posts are radial to the earth's circumference; consequently they diverge from each other as they recede from the earth's center. Of course, he is right, theoretically at least; and it has occurred to me that the fact makes an appreciable difference in the mensuration of land at different altitudes. I find this difference to amount to about $2\frac{1}{2}$ feet in a mile, in two miles difference of altitude. Can you inform me if this matter has ever been considered in its bearing on surveying?" REPLY.—If the rails are fixed in length, it takes more posts to go over the hill,—not because the posts are radial to the earth's circumference, but because the hypothenuse of a right angled triangle is greater than the base, and the length of the base if applied to the hypothenuse will not reach the vertex. The absolute distance intercepted between any two radii is of course greater, the greater the distance from the center. But this cause would make only an infinitesimal difference in any ordinary hill; while the steepness of the slope from the cause given above, might make a very large difference within a small horizontal distance and with a hill of no great altitude. In geodetic surveying, the calculations are always referred to the center of the earth.

ASBESTUS.—We have received numerous answers to our inquiry about Asbestos. Our correspondents will hear more from us soon.

F. M. S.—In reference to the maple sugar tree, next week.

F. A. H., Forbestown.—Communication received. Will receive early attention.

The State Geological Survey.

Even the higgary appropriation of \$15,000 for settling up the affairs of the Geological Survey, which at the time of our last going to press was reported passed, was at the last moment killed in the Assembly. A resolution was adopted instructing the Governor and Lieut. Governor to take charge of the hooks, papers, maps and accounts. No regard was paid to the fact that work still in the hands of the printers and engravers, and for which bills are now coming in, is thus to be left unpaid for; nor to the fact that the Chief of the Survey had already advanced the amount of his salary for three years past, to meet expenses, trusting in good faith to the Legislature to return him his own again. It is a disgrace to the State that he should be so treated.

Prof. Whitney is unquestionably a scientific man. The plan of work which he had laid out for himself was undoubtedly an elaborate and thorough one. But he was unfortunate in falling among a people who had no distinct conception of what a geological survey is. They demanded something visible, instant, for their money; never duly considering the fact, that the Professor's scientific reputation demanded that any work which should go out from his hands, must be such as to stand the test of future criticism. A little more clap-trap in his composition might perhaps have made him more popular for a time; but in the end it would have been worse for him. A little more *bonhomie* might have pleased those who look only at the surface of things; but it would not have enhanced his merit as a scientist. Most men, whether with or without merit, are misjudged by the mass. Especially is this true of the solid, thorough man, who is not showy. The mechanical dexterity of the *surgeon*, as he slashes off a leg with an air, captivates and dazzles the popular eye,—and forthwith he is hoisted, perforce, to the highest pinnacle of medical fame;—but the subtle brain-workings of the really accomplished *physician*,—by whose exquisite tact and discriminating judgment the knife is rendered unnecessary, and the limb saved,—do not thus impress the crowd, and so go for nothing.

A lot of red, green and yellow maps, purporting to exhibit the geological characters of different portions of the State, might perhaps have been issued by the Survey three years ago,—to astound and delight the natives; and they might perhaps have been correct in their general outline, and indeed in most points, within a score or two of miles; but that was not the kind of maps which the Survey understood that it was employed to make. A geological map must be based upon a correct topographical map, or it fails to be of any real value. If work thus loosely done had been offered to the people of California, the "long howl" of disapprobation which would by this time have greeted the ears of Prof. Whitney, would have been infinitely harder for him to hear, than the present ungracious and summary *squelching* of the whole affair.

It does not appear, so far as we know, that any proof exists, that the time of the Survey and the money of the State have been wasted. A large amount of material must have been collected. One would have supposed that the Legislature would have had the good sense to appoint an outside committee of experts to examine that material,—rather than a committee of men who confessedly knew nothing whatever of the subject. But the thing is done; and we fear that it will be long before another man who has any scientific reputation to lose, or any professional pride to be wounded, will offer his services to the State of California.

We shall again refer to this matter; giving in detail the present position of the work,—both as regards the progress which has been made, and its pecuniary condition.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

J. Arthur Phillips on Gold and Silver.

The recently published work of J. Arthur Phillips on "The Mining and Metallurgy of Gold and Silver," is designed, according to the author's preface, to "supply a want in our technical literature, which is very deficient in books treating of the mining and metallurgy of the precious metals." Both an examination of the book and the concurrent testimony of its numerous reviewers, justifies the conclusion that it is the most complete and useful work of the kind which has been written; in fact, it is the only work extant which even approximately answers its title. True, there is not much originality in the book, as it is chiefly a compilation from various sources—a bringing together in one volume a carefully prepared digest of about all that is known of the metallurgy of gold and silver. As such, it should be found in the possession of every miner and metallurgist in any way extensively engaged in the extraction of the precious metals. We are pleased to learn that it is thus rapidly finding its way into such hands throughout the Pacific Coast. It is not our present purpose to review this work; our object is simply to inform the readers of PRESS what the work is, so that those who have not seen it may judge for themselves as to the necessity or importance of procuring it.

The work consists of a large royal octavo volume of over 500 pages, beautifully printed and bound, and illustrated with eighty-four woodcuts and eight large plates, descriptive of mining machinery and mining operations as employed and carried on in the search for and extraction of the precious metals, in various parts of the world where they are found. It is divided into two nearly equal parts—devoted respectively to gold and silver.

The first part treats of gold, and commences with a brief description of its mode of occurrence and geological position. The author arrives therein at three important conclusions, derived from recent observations and experience. First, that "the most productive gold-bearing rocks are by no means confined to the Silurian period,"—according to the premature conclusions of Murchison, and most other modern geologists. The second is, that "aqueous agencies have been, and still are, actively at work in the formation of mineral deposits"—a matter, however, pretty generally admitted. The third, and most important is, "that gold ledges are not more liable than ordinary metalliferous veins to become impoverished in depth."

A very interesting though brief chapter is given on the "Gold Regions of the Old World." Then follows in succession, nine chapters under the following heads: Atlantic Gold Fields of the United States; Gold Fields of the Pacific Coast; Mexico, Central and North America; North American British Possessions; Gold Working in California and Australia; Vein Mining in California and Australia; Vein Mining in Hungary and Brazil; Assays of Auriferous Ores; Estimation of Gold Contained in Quartz, Refining, Assay of Gold Bullion, etc.

Part Second commences with a description of the mode of occurrence and geological position of silver; followed by an interesting chapter on the principal silver mines of the world. The author then proceeds to treat more fully upon the silver mines of North America, and of Central and South America. The balance of the work, nearly 200 pages, is devoted to the metallurgical treatment of silver ores, as follows:—Treatment of silver by amalgamation—by the patio process, by the harrel process, by the pan process, by solution and precipitation, by smelting; extraction of the precious metals from argentiferous and auriferous lead, which has been obtained by smelting; treatment of argentiferous galena at Pont-gibaud; smelting of silver ores in Mexico; assay of silver ores and bullion.

The above brief summary of the contents of the volume will convey to the reader, who has not seen it, a very fair idea of its subject matter. The work will be seen to cover the whole field of the mining and metallurgy of the precious metals, and supplies a want long felt in that branch of technical literature. It has its faults, but they are few and immaterial, and such as might readily be expected in a work comprising so large a range of thought and research, hastily compiled as this has been. The title may be too ambitious; but it does not pretend to be exhaustive. As an original contribution to science it may have little value—it makes no such assumption; but as a compilation of the observations of others it will be found very valuable. It is the best thing of the kind we have, and the only one which is at all general or comprehensive. For sale by H. H. Bancroft & Co., of this city.

MORE MINING MACHINERY FOR CENTRAL AMERICA.—Some three or four months since we noticed the fact that the English Mining Company, known as the Javali G. & S. M. Co. of the State of Grenada, in the Republic of Nicaragua, had ordered a 10-stamp mill from the Union Foundry in this city, preferring to obtain their machinery here, rather than from the English foundries, for the reason that our mechanics are better posted as to the character of machinery needed than English mechanics. We have now to state that the same company has ordered another mill of the same capacity from the same foundry. Wheeler pans with a Belcher settler and Blake's crusher will accompany the stamps. The whole will be driven by an 18-inch Tyler turbine wheel, with 62 feet fall. The order for this mill is unusually full and complete, calling for a general fitting out of everything necessary about a quartz mill,—such as cars for tramways, wheelbarrows, carts, pans, shovels, picks, retorts, quicksilver, and an assay furnace and general assortment of chemicals. Even the literary portion of an outfit was not forgotten; as copies of Kustel's book, J. Arthur Phillips' late work, Randall's Quartz Operator's Hand-book, a file of the MINING AND SCIENTIFIC PRESS, etc., etc., are included in the order. The Javali Company is bound that there shall be no failure at their mines from lack of the necessary appliances and guides for properly opening and working the same. May their success be equal to their liberality and enterprise.

THE CHINESE EMBASSY.—Hon. Anson Burlingame, Envoy Extraordinary and Minister Plenipotentiary from the Chinese Government to the Treaty Powers; Chin Tajen and Sun Tajen, Chinese Ministers; J. McLeary Brown, First Secretary of Legation; Monsieur E. de Champs, Second Secretary of Legation, six interpreters, two English, two French and two Russian; two writers, a native doctor and fifteen servants, arrived by the steamer *China* on Tuesday last. It is expected that the party will leave by the *Golden Age* on Monday.

ARMY AND NAVY TELEGRAPHING.—The systems of signaling and telegraphing adopted by government are now uniform in both our army and navy. The cadets at West Point and the midshipmen at Annapolis receive the same instructions, so that when they become officers in any contingency of land or naval service, they will be enabled to open and maintain communication, by codes of signaling and electric telegraphy identical in their operation.

RAILROAD IMPROVEMENTS.—The New York and New Haven Railroad Company is now making experiments in new inventions, giving a promise of success. New steel rails have been laid down. Baker's car-heater has been adopted, the new compartment cars are in use, and experiments are being made with a new magnetic signal.

The Stetefeldt Roasting Furnace.

We have recently heard, from various sources, favorable reports with regard to the effectiveness and economy of the Stetefeldt roasting furnace. It has been thus far used only upon silver ore, which it readily chloridizes as close as 87 to 91 per cent., and delivers the ore neither baked nor burned, and entirely free from lumps. The first thorough practical test to which it was submitted was at the Murphy mill, in Ophir Cañon, near Austin, Nevada.

This furnace is constructed on the shelf or terrace principle, which consists of an upright stack with shelves; the pulp being fed in at the top and slowly dropping from shelf to shelf, until it reaches the bottom. This principle has been employed, with various modification, in Germany, for many years, and has recently been introduced into California by Mr. Mosheimer, of this city, under whose direction several of these furnaces have been constructed within the past two years, and all, so far as we have learned, have given much better results than the ordinary reverberatory furnace. The plan of construction adopted by Mr. Mosheimer is a combination of the shelf with the reverberatory, and has been already fully described in the PRESS.

Mr. Stetefeldt's furnace entirely dispenses with the reverberatory attachment, but has a dust chamber connected with his stack, by which the very fine particles of ore and metal which are unavoidably carried up the flue by the draught, in every description of furnace, are supposed to be arrested, and saved. We give from the Reese River *Reveille*, the following description of this furnace:

The furnace built at the Twin River mill, which was designed simply for experimenting, consists of a plain shaft, 22 feet high, four feet square inside at the bottom, and three feet square at the top. The flames from the fire-places, which are built on opposite sides of the shaft, enter it three feet from the bottom. The roasted ore accumulates at the bottom. Near the upper end of the shaft are four flues, which unite into one horizontal flue connected with a small fire-place designed to roast the fine dust that escapes through the flues. This horizontal flue is connected with a perpendicular one leading down into the dust-chamber. This chamber covers an area of ten by eighteen feet, is ten feet high, and surmounted by an iron chimney two feet in diameter and thirty feet high. In the first experiments the machinery for feeding the pulp into the shaft consisted of fluted rollers revolving slowly in the pulp and shoving it through the slits of an iron plate which covered the top of the shaft. Although these rollers fed quite regularly they did not discharge the pulp in a proper form, but it entered the shaft in lumps which could not be penetrated by the heat in the few seconds in which it was falling to the bottom. Fine pulp has the peculiarity of sticking together like the drops of a liquid if thrown through the air, and does not separate and scatter like sand. The invention of the proper apparatus for feeding the pulp was now the main point to render the furnace perfect. After several partially successful trials, the right principle was deduced from the cohesive properties of the fine pulp, and machinery was constructed accordingly. The plan is very simple. A coarse sieve is moved between a fine sieve (through which the pulp is discharged into the furnace) and a hopper filled with pulp. As it is difficult to give a concise and particular description of machinery without the aid of a drawing, we will only remark that this machinery worked admirably, although a few slight improvements suggested themselves to Mr. Stetefeldt which will render the feeding apparatus absolutely perfect. For the fine sieve sheet iron plates, punched with holes from 1-16th to 1-20th of an inch in diameter, were used, and proved to be very durable. The coarse sieve was made of iron wire, screen with quarter inch holes.

The operation of the furnace is exceedingly simple. The salt is mixed with the ore on the dry kiln, and they are both crushed together. Not more than eight per cent. of Spaulding's salt (which contains only 63 per cent. of pure salt), or five per cent. of pure salt was used, while twelve per cent. of the same article was used in the reverberatory furnaces of the

Twin River mill. In a properly constructed furnace the pulp will be conveyed by machinery from the battery to the hopper, and the feeding will be done also by machine power. The firing of the furnace may be regulated by two observations; if the ore at the bottom of the shaft has a tendency to bake together the temperature is too high; and if the dense white smoke of hydrochloric acid which arises from the chimney diminishes considerably, it is too low. It was supposed by many who had examined the furnace that the chlorination of the pulp would be accomplished by lying at the bottom of the furnace. But the supposition is entirely erroneous, as every particle of the pulp is perfectly roasted as soon as it reaches the bottom. The operation of the furnace is unique in that nearly all the chlorides of the base metals are decomposed by the steam contained in the flame, and hydrochloric acid and oxides formed. For this reason the same ores will give finer bullion in amalgamating than they would if roasted in a reverberatory furnace.

Mr. Stetefeldt has obtained a patent for this furnace, and has brought it to its present state of perfection, only at great cost of time and money. According to the authority before us, this furnace accomplishes its work more thoroughly than any other in use in Nevada. The cost of the Stetefeldt furnace is set down at 30 per cent. less than a reverberatory; while the former is capable of doing several times as much work during a given time. As to its working economy the following comparative estimates are given:

Present cost of roasting sixteen tons of ore at the Twin River mill—eight reverberatory furnaces being used—

24 roasters at \$4 each.....	\$96 00
2 foremen at \$3 each.....	10 00
2 carmen at \$4 each.....	8 00
2 pulv. coolers at \$4 each.....	8 00
7 cords of wood at \$8 50 per cord.....	59 50
12 per cent. of salt at \$40 per ton.....	48 00
Material and repair of tools.....	12 00
Total cost.....	\$230 50

IN STETEFELDT FURNACE.	
2 men to overlook machinery.....	\$8 00
3 foremen at \$4 each.....	12 00
2 pulv. coolers at \$4 each.....	8 00
3 cords of wood at \$8 50 per cord.....	25 50
8 per cent. of salt at \$40 per ton.....	32 00
Sieve and tools.....	3 00
Total cost.....	\$107 70

These comparative estimates show a saving in roasting 16 tons of ore in the new chloridizing furnace over the reverberatory furnace of \$162.70. The cost of roasting in the former furnace is less than \$7 per ton; in the latter it exceeds \$16 per ton. The expense of roasting in the reverberatory furnace, when it is properly conducted to a good result, is not under the most favorable circumstances less than \$15 per ton. Increasing their number hardly lessens the expense per ton. On the other hand the inventor of the new furnace is prepared to show, that one possessing the capacity of 32 tons would not cost 25 per cent. more in construction than one-half the size, while the expense of roasting would be reduced to about \$5 per ton. These extraordinary results are entitled to the consideration of intelligent millmen everywhere.

EASTERN MACHINERY AT A DISCOUNT.—The Social and Steptoe Mining Co., of Egan Cañon, Nevada, (located almost directly upon the dividing line between that State and Utah Territory) ordered a 20-stamp mill from the East, some time last summer, which was transmitted overland. On its arrival at Salt Lake City, the mill portion was found to be entirely worthless, and the Superintendent decided to abandon it at that point. Nothing but the engine will be taken hence to the mine; entire new machinery for the mill will be ordered in this city. A heavy expense is thus entailed upon the company, which might have been saved by giving their order to a San Francisco foundry at first. Our Eastern friends will save much time and expense in putting their mines into operation by abandoning all idea of buying their machinery at the East. Not one mill in fifty that is sent to this coast from the East, is worth anything more on its arrival here than its value for old iron. It is high time this fact was more generally known and recognized.

MINING COMPANIES are referred to the card of H. H. Sheldon, M. E., in another column. Mr. S. has had large experience as a mining superintendent, and gives references of the highest character.

Contributed for Our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, carbonates, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and forwarded with the name of the donor, and the claim or location from whence it came.

209, 210—Alexander Hestlin has contributed several samples of silver ore from the Social and Steptoe Co's mine, Egan Cañon, Nevada, located almost immediately upon the dividing line between that State and Utah Territory. The first numbered specimen is from a depth of about 200 feet, and consists mostly of silver sulphurets, more or less decomposed and stained with copper. The last numbered was taken out 100 feet deeper, is less decomposed, and shows free gold. The proportion of gold in this mine increases with its depth. The ore pays from \$100 to \$150 per ton, and is worked fully up to 75 per cent. of its assay value. A 5-stamp mill was erected on the mine some three years ago, which will be replaced this summer by a mill of 20 stamps, the machinery for which will be ordered in this city.

MEDICAL AUTHORITIES have announced that not less than one-fifth of the entire population of the United States are afflicted with Neuralgia in some form. Surely the man who can safely remove such a vast aggregate of pain is a great public benefactor. Such is Dr. Turner, of Boston, in Massachusetts. His "Universal Neuralgia Pill" is pronounced on all hands, to be an entirely harmless and perfectly certain remedy for this most torturing of all known diseases. See advertisement in another column.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions twenty per cent. cheaper than ever before, and the very best articles in market. The store is located at 115 Sutter street, Lick House Block. 2v151r

Pacific Chemical Works.

Sweet Spirits of Nitre.

Messrs. Falkenau & Hanks—Gents—Having carefully compared your Spirits of Nitro with Samples of Eastern manufacture I cheerfully testify to yours being fully equal to the best thereof. GEO. S. DUCKEY, Pharmacist, Chemist, cor. Fourth and Market sts.

We hereby certify having used during the last two months the Sweet Spirits of Nitro, now manufactured by Messrs. Falkenau & Hanks, of the Pacific Chemical Works of this city, and find the same to be a good and reliable article, and equal to any European or Eastern manufacture. J. C. LEFERE & Co., Apothecaries, Cor. Dupont and Washington sts.

Messrs. Falkenau & Hanks—Gents—1 have examined a bottle of Spirits of Nitro, handed me by you, and find it equal to the best imported. J. C. LEFERE & Co., 131 Montgomery St.

Messrs. Falkenau & Hanks—1 submitted to Chemical tests several samples of Sweet Spirits of Nitro, and found sample marked No. 1 in density and percentage of Nitro. Either equal to Powers & Weightman's 1 obtained from a wholesale house in this city. CHAS. H. ZEILE, Clay street, opposite Plaza.

Messrs. Falkenau & Hanks—Gents—1 have used your Sweet Spirits of Nitro for the last two months in my prescription store, and find it to be equal to any manufactured by others, even to Powers & Weightman's. J. C. MOODY, 102 Kearny st., and cor. Fourth and Mission.

Messrs. Falkenau & Hanks—Gents—1 have tested and used the Sweet Spirits of Nitro, prepared by you, and find it to be equal to Powers & Weightman's, or any other I have heretofore used. H. W. SCHMIDT, Cor. Sacramento and Kearny sts.

Messrs. Falkenau & Hanks—We have used your Sweet Spirits of Nitro, and find it equal to any we have used heretofore. A. McBOYLE & CO., Washington street, near Sansome.

Messrs. Falkenau & Hanks—We have received the Spirits of Nitro of your manufacture, and find it a good article. SUPPARDSON & CO., 619 Montgomery street, San Francisco.

Number of Policies issued in 1867, 10,300.

Amount insured, - - \$31,375,671 00.

POLICIES ISSUED AT ONCE,

On receipt of Application at the San Francisco Branch Office, without referring to the Home Office at New York.

Policies Paid in Gold Coin or Greenbacks,
at the option of the person insuring.

[Extract from report of the Home Office, for Dec. 1867.]
"The Company's history for the past fifteen years shows favorably, and it stands today ranks 11 among first class Societies. It has carried out in good faith every contract made by it, never contesting a Southern claim during the war, while it is well known that many of our largest companies repudiated their Southern risks at the commencement of our National struggle, thereby increasing their assets. This honorable dealing of the Knickerbocker in the past, is a pledge of its future good faith."

THE NEW GAS LIGHT.—The American Gas
Light Journal translates from the Paris
Petite Presse of January 16th, the French
extacies over the new light. This is the ar-
rangement which we have already noticed
in former numbers of the PRESS; being es-
sentially the Drummond light with a piece
of magnesia instead of lime under the ig-
nited oxy-hydrogen jet. Manganate of soda
is used as the source of the oxygen; and it
is claimed that while it has heretofore cost
about four dollars per thousand cubic feet,
it can now be furnished for thirty-nine
cents. La Presse thus describes the manner
of producing the light:—"In the first place
a reverberatory furnace heating seven re-
torts having a capacity, each, of about 150
kilogrammes (330 lbs.) of the manganate of
soda. In addition to this, a boiler, a con-
denser, a steam engine, a blower, and two
gas-holders holding about 15 cubic metres
(530 cubic feet) each.

These items of apparatus are erected in
the vaults of the 'Assistance Publique' at
the Hotel de Ville, where any one can visit
them.

The steam is superheated to about 450
deg. (Centigrade, we presume—equal to
842° Fahr.), and then by a suitable arrange-
ment is suffered to enter the first retort.
Thus brought into contact with the super-
heated steam, the manganate of soda be-
comes decomposed, and relinquishes its
oxygen, which is swept off into the con-
denser by the steam. The condenser is full
of wet coke which condenses the watery va-
pors, and permits the oxygen to pass to the
gas-holder, ready for use.

When a retort has been stripped of oxy-
gen, manganese and soda remain behind.
The steam jet is arrested, and immediately
replaced by a current of cold air thrown
into the retort by a powerful blower driven
by the engine. Thus brought in contact
with the air, which, as we all know, con-
tains 21 per cent. of oxygen, the manganese
is again oxidized, and recombines with the
soda to form again the manganate of soda.
The same process may be renewed indefi-
nitely, the same substances always pro-
ducing oxygen.

By means of separate tubes, the oxygen
from the gas-holders in the vaults, and the
hydrogen from the ordinary gas mains are
led to the burner; they are brought into
contact at the point of lighting, and their
flame is directed against a piece of magnesia
which instantly throws out the magnificent
brilliance which all Paris has admired."

In remarking upon this new light, the
Gas Light Journal says that it is destined to
be a failure, notwithstanding the delight of
the excitable Parisians with it. It calls it
"this Drummond Redivivus,"—and says
that the very features which made its proto-
types useless for general purposes, are recog-
nizable in it. It would be liable to con-
stant derangement; and make a chemist as
necessary in every household as a cook.

UTILIZATION OF WASTE COAL.—A series
of experiments recently made by a Board of
Engineers, appointed by the Navy Depart-
ment to examine into the various methods
of employing anthracite and bituminous
coals as fuel, go to show that the large
amount of finely broken coal now wasted at
the mines in this country and in Europe,
could be profitably utilized. The pulveri-
zation of this coal might be made complete,
and it could be used with a forced blast
above the ordinary coal fire. The experi-
ments above alluded to, show that the effect
produced with pulverized coal exceeds
that with the same weight of lump coal by
from 20 to 30 per cent. Statistics show that
while the mines of Great Britain yield more
than 100,000,000 tons of marketable coal
per annum, about 30,000,000 tons more of
waste coal are left at the mines. The per-
centage of waste coal at the anthracite mines
of this country is somewhat less than at the
bituminous coal mines, yet it has been
estimated at about twenty-five per cent. of
the whole weight brought to the surface.
The utilization of this waste coal would vir-
tually add one-third more to the value of
the annual product of American mines, and
eventually cause a corresponding diminu-
tion of the prices paid by the consumer;
therefore it may be safely averred that no
improvement has been lately proposed
which compares in general importance with
that which would make available the waste
product of coal mines.

PRESERVE YOUR SIGHT.—Adopt specta-
cles suited to your eyes. C. Muller, Op-
tician, thoroughly understands his profes-
sion, 205 Montgomery street. *

PRACTICAL AS WELL AS THEORETICAL MINING ENGINEERS.—W. W. Kenrick writes thus to the *London Mining Journal*:—"I am of opinion that the profession of the mining engineer is the most difficult and responsible of the whole department of engineering, for in no other branch is there required such a combination of skill, perseverance, judgment, and personal courage; and, therefore, it is all the more necessary that we give our most serious attention to the subject of mining education. We are daily witnessing the failure of concerns which should by all reasonable calculations have proved successful: thousands of pounds are actually thrown away through inefficient mining.

Deficient ventilation, bad underground roads for conveyance of coal, improper methods of supporting the roof, and opening out the workings, the most injudicious division of labor, together with the want of order and system, may be met with at the present time to an astonishing extent in some mining districts of this country, to which causes are attributed in a great measure the accidents which are so frequently occurring, and the failure in a commercial point of view of the most promising concerns. It is the opinion of one of the most eminent mining engineers that "the speediest and most effective remedy we can suggest is that all responsible managers of mines be required by Government to obtain certificates of practical and theoretical competency for their situations before being allowed to enter upon them. Local boards of examiners could easily be established for this purpose; and it would be no difficult task to so combine the practical in examinations with the educational and scholastic as to preclude the possibility of any mere theorist obtaining a certificate, as in many instances through a mistaken notion of economy by proprietors, men are employed as responsible managers who are totally ignorant of the most elementary principles of mechanics, the laws of gas, the principle of the safety-lamp, the geometry of figures formed by faults and heaves, and the theory and accurate practice of surveying and leveling. To what source, therefore, are we mainly to look for such improvement as shall make mining a safe and profitable investment? To this I reply, the mining engineer himself, to whom it is just as important that mining should be a good investment, as it is to the capitalist whose money furnishes the needful appliances."

Smelter Wanted.

A WORKING MAN, CAPABLE OF TAKING CHARGE of one of the shifts in running a Blast Furnace, for reduction of Lead and Silver Ores. Address this office. 13v16trp

To Capitalists.

FOR SALE—THE CONTROLLING INTEREST IN ONE of the best Gold and Silver Mines in the State of Nevada. The owners not having sufficient means to purchase the necessary machinery to work to advantage, will dispose of a portion of the mine at a bargain. Any one willing and able to embark in the enterprise, will be shown and probably convinced that it is no visionary scheme. The ledge will now pay more than the expense of working it, and is very rich, increasing in width at every foot in depth. For particulars apply at this office. 13v16-1m

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be recommended on reasonable terms. Information given, and all necessary papers correctly made out. Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

JAMES VINSONHALER.

Rates of Postage on Printed Matter to Europe and Asia.

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:

Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:

NEWSPAPERS—MARKED AS FOLLOWS:

Bremen, by Bremen mail—2 cents each.
Hamburg, by Hamburg mail—2 cents each.
Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.
Lunenburg, by Bremen mail—3 cents each.
Lunenburg, by Hamburg mail—3 cents each and 1 cent per 1½ ounce.

Schleswig-Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1½ ounce.
Sweden, by Bremen or Hamburg—3 cents each, and 1½ cent per 1½ ounce.
Norway, by Bremen or Hamburg—3 cents each, and 3½ cents per 1½ ounce.
Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.

Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.
Switzerland, by Bremen or Hamburg—4 cents each.
Italy, by Bremen or Hamburg—5 cents each.
Turkey, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.
Greece, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.
Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 2½ cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1½ ounce.
Austria, India and China, by Bremen and Hamburg mails via Trieste—3 cents each, and 2 cents per ½ ounce.

PERIODICALS, ETC.

Bremen, by Bremen mail—1 cent per ounce.
Hamburg, by Hamburg mail—1 cent per ounce.
Prussia, Austria and German States, by Bremen or Hamburg mail—1½ cent per ounce.
Lunenburg, by Bremen mail—1½ cent per ounce.
Lunenburg, by Hamburg mail—1½ cent per ounce, and 1½ cent per 1½ ounce.
Schleswig-Holstein and Denmark, by Bremen or Hamburg—1½ cent per ounce and 1½ cent per 1½ ounce.
Sweden, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.
Norway, by Bremen or Hamburg—1½ cent per ounce, and 4 cents per 1½ ounce.
Holland, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.
Russia, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.
Switzerland, by Bremen or Hamburg—1½ cent per ounce, and 1 cent per ½ ounce.
Italy, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.
Turkey, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.
Greece, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.
Gibraltar, Spain and Portugal, by Bremen or Hamburg—1½ cent per ounce, and 2½ cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mail by way of Marseilles—1½ cent per ounce, and 9 cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mail, by way of Trieste—3½ cents per ounce, and 2 cents per ½ ounce.

These charges are in each case in full to destination, combining rates between the United States and Bremen or Hamburg, and the rate beyond Bremen and Hamburg to points of delivery.

MOSHEIMER'S

Pioneer Mining School,

ASSAY OFFICE

—AND—

Metallurgical Works,

SAN FRANCISCO.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

1.—Assaying of Ores, Metals, and other Mineral Substances.

2.—Metallurgy of Gold, Silver, Copper, Lead, etc., by Smelting, Amalgamating, Lixivation, etc.

3.—Gold Extraction, by Chlorine Gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.

4.—Concentration.—Dressing of Ores.

5.—Construction of Furnaces, in which any kind of fuel may be used for Smelting, Roasting, etc., as well as the erection of any Machinery or Apparatus required in Metallurgy and Technology.

6.—Technology, or Chemistry as applied to any special branch of Manufacturing.

By my Practical Mode of Teaching, any person of ordinary ability can learn to assay Ores in three lessons, and the working of all the ordinary and refractory ores in a few weeks.

Gentlemen of almost every profession, who, within the last two years have graduated at my establishment, will bear testimony that from my instructions they have learned more in a few weeks than they ever expected to learn.

My charges are from \$50 to \$200.

Ores of every description assayed and worked
JOSEPH MOSHEIMER,
Pr. Chemist, Metallurgist, C. E. etc.

Office, 328 Montgomery street. Works, 2,065 Powell street. 3v16-3mcw

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence, Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

AN INSTRUCTIVE BOOK!

PROF. LAYNES

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, PROF. LAYNES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetic and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Sedg.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Pelton.

After careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hill.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—F. W. Hatch.

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the application of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—James Denman.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. Hunt, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—I. H. Brayton.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—John Curry.

The subjects upon which you treat herebefore been too much neglected in the education of young men in America. * * * Especially calculated to interest. * * * It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Bosc.

A gentleman of varied languages and fine culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Laynes has done the cause of popular education good service.—S. F. Bulletin.

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—Alta California.

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times

Prof. Laynes plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken), divides it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its complexity; and then shows you how to put them together again. A series of such experiments, increasing in complexity, so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt supplied.—S. F. Examiner.

This is an anecdote in which the occasions are rapidly multiplied, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—Stockton Independent.

The most eminent educators in California give it their hearty approval, and we concur.—Marquette Express.

Not only one of the best of its kind, but, what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Address DEWEY & CO., Mining and Scientific Press, San Francisco.

New Mining Advertisements.

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpine County, Cal.

And in accordance with law, and an order of the Board of Trustees, made on the thirtieth day of February, 1883, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Olney & Co., auctioneers, 413 Montgomery street, San Francisco, on Wednesday, the fifteenth day of April, 1883, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. CROWNSHIELD, Secretary.
Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. ap1

Nuestra Señora de Guadalupe Silver Mining Company. Location of Works: Tayolilla, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-seventh day of March, 1883, an assessment (No. 31) of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. PEPPER, at his office, No. 210 Post street, or to the Treasurer, A. H. WELLMAN, at his office, No. 637 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of April, 1883, shall be deemed delinquent and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the nineteenth day of May, 1883, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, E. J. PEPPER, Secretary.

Office, No. 210 Post street, San Francisco. ap4

San Francisco and Castle Dome Mining Company. Location of Works: Castle Dome County, Arizona Territory.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-sixth day of February, 1883, the several amounts set opposite the names of the respective shareholders as follows:

Foggs Mill and Mining Company.—Location of Works: Amador County, Cal.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the nineteenth day of February, 1883, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
G. D. Keeney...	5	40	\$40 00
G. D. Keeney...	16	20	20 00

And in accordance with law, and an order of the Board of Trustees, made on the nineteenth day of February, 1883, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 321 Front street, San Francisco, Cal., on Thursday, the ninth (9th) day of April, 1883, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN J. SCOTCHILLER, Secretary.
Office, No. 321 Front street, San Francisco. mar29

Great Central Mining Company.</

took full four hours. The results I obtained were very satisfactory in one respect, viz., extraction of the silver;—but not so good with the gold. Other gentlemen have done better than myself. I believe the process is excellent for silver,—and so it would be for gold, if the ores were calcined; but we wanted this. It was said the machine would decompose the sulphurets—(i. e. the chloride of sodium would),—without the aid of fire; such, however, was not the case in the trials I made, neither did I believe it would be. However, this apparatus is not very costly; the patentee asks \$5,000 for the patent license. There are several now being put up in Colorado and Nevada.

M. DU CHAILLU AND THE CANNIBALS.—The New York correspondent of the *Bulletin* says: "M. Du Chaillu continues to draw crowded audiences to his lectures. In his last Monsieur had much to say about his adventures in the cannibal country of Equatorial Africa, where human flesh is rated according to age and sex, women being considered the tenderest, and both sexes when young preferable to the old. The lecturer remarked upon the fear with which he was constantly beset while sojourning in this country lest he should become a victim. Especially would this fear come upon him in the presence of the women, who gazed upon him incessantly with longing eyes, ever seeming to be tempted to take a bite of his flesh without waiting for cookery. On one occasion he came suddenly upon a woman who appeared to be the last lingerer at a feast, and who, on seeing him, started off at full speed with the leg of a man under her arm."

All About Sending Money by Mail.

RATES OF COMMISSION.—The following are the rates charged (in currency) for transmitting money to any part of the United States:

On Orders not exceeding \$20.....10 cents.
Over \$20 and not exceeding \$50.....15 cents.
No fractions of cents to be introduced in an Order.
United States Treasury Notes, or National Bank Notes only received or paid.
To send over \$50, additional Orders must be obtained.
Post Offices where Money Orders may be obtained will furnish blanks as follows, which the applicants will fill out:
No. Amount Date,, 186 ..

MONEY ORDER.

Required for the sum of \$..... Payable at
State of Payable to Residing at
State of Sent by
Residing at State of
Entered in Register:

Names of parties and places, and the sums, to be written in the plainest possible manner.

As there are several places of the same name in the United States, applicants must be careful to indicate which of them they mean; and the Postmaster will satisfy himself, before writing out the order, that the place indicated is the one intended.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are now the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1865; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED
FOR
Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES
Fifty Per Cent.
LESS POWER
Than any Blower
now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For Circulars and further information, address

KEEP, BLAKE & CO.,
Globe Iron Works, Stockton, Cal.

WE ARE NOW OFFERING OUR IMMENSE STOCK

**A SAFE,
CERTAIN,
AND
Speedy Cure
FOR
NEURALGIA,
AND ALL
NERVOUS
DISEASES.
Its Effects are
Magical.**

It is an UNFAILING REMEDY in all cases of Neuralgia Facialis, often effecting a perfect cure in less than twenty-four hours, from the use of no more than two or three PILLS.

No other form of Neuralgia or Nervous Disease has failed to yield to this

WONDERFUL REMEDIAL AGENT.

Even in the severest cases of Chronic Neuralgia and general nervous derangements,—of many years standing,—affecting the entire system, its use for a few days, or a few weeks at the utmost, always affords the most astonishing relief, and very rarely fails to produce a complete and permanent cure.

It contains no drugs or other materials in the slightest degree injurious, even to the most delicate system, and can always be used with

PERFECT SAFETY.

It has long been in constant use by many of our most eminent physicians, who give it their manly and unqualified approval. Sent by mail on receipt of price, and postage.

One package	Price	Postage
.....	\$1 00	6 cents.

ASSAYER AND WORKER OF ORES,
SAN FRANCISCO FOUNDRY,
8 E cor. Howard and Beale streets, San Francisco.
Highest price paid for choice lots of Ores, Sulphurets, Assay Anodes, Sweepings, etc., etc., and all kinds of materials in all branches of Metallurgy, on liberal terms.
11v16-4r.

Parties desirous of Taking
A COURSE OF INSTRUCTION

CHEMICAL ANALYSIS,
THE ASSAY OF ORES,
And the Use of the Blow-pipe,
OR ANY PART OF SUCH COURSE,
May apply at this Office.

Pupils will have the advantage of a Complete Laboratory.

BRANCH
OF THE NEWARK, N. J.,
Metallurgical Works.

BALBACH & BROTHER,
No. 315 Howard Street, bet. Fremont and Beale, San Francisco.

Assays of Gold, Silver, Copper and Lead Ores.

Gold and Silver Ores and their Sulphurets, worked in any quantity, from a few pounds to any number of tons, if desired, by the Chlorine Process. Also, Jewellers' and Bankers' Sweepings.

Consignments of Gold and Silver Ores solicited.

Refining of Bullion at usual rates.

Agents for Ed. Balbach's Improved Process for Separating Silver and Gold from Lead.
25v15-3m

JOHN TAYLOR & CO.

IMPORTERS,
AND DEALERS IN
ASSAYERS' MATERIALS,
Druggists' & Chemists' Glassware,
Photographic Stock, Etc.
512 and 514 Washington Street,
SAN FRANCISCO.

WE are receiving direct from MESSES. LADD & OERTELING (London) and BEEKER & SONS (Antwerp, Belgium) their superior

ASSAY AND BULLION BALANCES,
And from France and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, MUFFLES, BLOW-PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have given this branch of our business particular attention, to select such articles as are necessary in the development of the mineral wealth of this coast. A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUNDRIES, ACIDS and CHEMICALS, constantly on hand.
San Francisco March 6, 1865.

MANHATTAN
Metallurgical and Chemical Works,
Nos. 552 and 554 West Twenty-eighth st.,
NEW YORK.

Assays of Gold, Silver, Copper and Lead Ores.

SPECIAL ATTENTION GIVEN TO THE ANALYSIS OF Ores, Minerals, Clays, Waters, and General Commercial Products of all kinds.

Tests of Gold, Silver, Copper and Lead Ores, by Smelting, in quantities of fifty pounds to five, ten or fifty tons. Consignments of ores solicited.

Refining of Bullion at usual rates. Foundries and Metal Workers furnished with alloys of every description. Parties requiring plans and specifications for the erection of Smelting Works, can be supplied, and the actual process while working shown.

Plans and specifications furnished for works, and processes for the manufacture of Sulphuric Acid, Soda Ash, and general Chemical Products.

Superintendent, Mr. WILLIAM WEST, formerly of Swansea, Wales.

HARRY & PATTEN,
413 Montgomery street, San Francisco.

The Illinois Agricultural Society offers premiums of \$100, \$75, \$50 and \$25 for the best groves of young forest trees. California might do well to offer similar inducements for the encouragement of the growth of forest trees in the Sacramento and tributary valleys.

A GOOD EXAMPLE.—On the Hudson River Railroad, there is a flagman to every mile. By day or night, after the passage of every train, every rod of the track is walked over, and every rail, chair, and tie is inspected.

HENDY'S LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators or pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:
FIRST—In setting up, set the pan, A, level by the inner rim, near its center.
SECOND—While in operation, keep the Pan, A, about half full of sulphurets.
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL. (8 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators).....	Grass Valley, Nevada County.
NORRIDGEWOCK MILL. (2 Concentrators).....	Grass Valley, Nevada County.
VALENTINE & CO., Commercial Mill (3 Concentrators).....	Nevada County.
HUMBOLDT CANAL CO. (1 Concentrator).....	Humboldt County, Nevada.
ROBINSON & McALLISTER M. & M. CO. (3 Concentrators).....	Hunter's Valley, Mariposa County.
PLYMOUTH ROCK MILL CO. (2 Concentrators).....	Calaveras County.
MIDAS MILL CO. (4 Concentrators).....	Virginia, Montana.
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....	Virginia City, Nevada.
VULTURE CO. (8 Concentrators).....	Prescott, Arizona.
NOYES & CO'S MILL. (2 Concentrators).....	Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....	Owyhee District, Idaho.
MOREY & SPERRY (1 Concentrator).....	New York.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Sinaloa, Mexico.
EL TASTE CO. (2 Concentrators).....	Sonora, Mexico.
B. F. BROWN (1 Concentrator).....	Melbourne, Australia.
JAMES HENTY & CO. (1 Concentrator).....	Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.
J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,
S. W. LEE, Snpt.

NORTH STAR MINE, Grass Valley, Feb. 26, 1868.
J. HENDY, Esq.—Dear Sir:—In answer to your request, I give my opinion in regard to the eight Concentrators we have at work. We have had one at work on blanket washings for the past three months, and it has proved highly satisfactory in saving sulphurets and amalgam, that in past years we have been losing. Of the other seven, six are taking the pulp from the batteries, and the remaining one concentrating from the six, which, when thus reconcentrated, yield 95 per cent. of pure sulphurets. Respectfully, etc.
W. H. RODDA, Supt.

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. Co.,
VIRGINIA CITY, Nev., Sept. 17, 1867.

JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours, very truly,
LOUIS JANIN, JR.
The bill was presented in accordance with the above request, and duly paid.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY. and 7—SELECTED COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1j16p

Cameron's Special Steam Pump.

The present illustration represents the Patent Steam Pump of Mr. A. S. Cameron & Co. of New York, and is styled by them the "Special Steam Pump," to distinguish it from the various other patterns of steam pumps which they are manufacturing. This pump is used for feeding boilers, elevating water, blowing air for draining mines, etc. For the last purpose it is used to a great extent among the coal mines in Pennsylvania. The makers are now building one with a 70-inch steam cylinder, and have increased their facilities for manufacturing by the recent purchase of the extensive estab-

lishment entirely with 'channel ways,' ports or 'passages.' By removing one bonnet the whole interior is exposed, and there is not a spot where a single speck can lodge without being detected. The whole machine works noiselessly. Its compactness, simplicity, strength, lightness, and consequent cheapness, must recommend its use in every situation where a pumping engine is required." David Stoddard, 114 Beale street, is agent for the sale of these pumps, as also of the various other patterns from the same manufacturers; some of which have fly-wheels, others being steam and hand pumps combined.

NEW INVENTION.—Mr. Z. P. Davis, of Nevada, has invented a new cartridge for

PRINCE ALFRED AMONG THE MINERS.—His Royal Highness Prince Alfred, has recently visited several of the Australian mines. All sorts of attentions were shown him, from Ballarat to Bendigo. The Prince, with his party of Honorables, descended several shafts at the gold mines of the latter place. His Royal Highness, on these occasions, wore a red shirt, like ordinary mortals. At one place he descended the shaft in a cago made on purpose for him. At another, a pick, also made for the occasion, was swung lustily against the wall by him for several minutes, thereby showing conclusively that he, too, was thoroughly acquainted with the art of mining. The de-

lighted miners pronounced him a "regular brick." The fact that His Royal Highness perspired freely, during this performance, is duly recorded. Whether His Royal Highness used his pocket handkerchief in consequence, is, however, not stated.

At these Bendigo quartz mines, His Royal Highness condescended to accept a number of rich specimens, of considerable value. At the sluice washings of Ballarat, divers nuggets, varying in weight from three to ten ounces, were presented to him;—all of which His Royal Highness graciously pocketed. "Appropriate remarks" accompanied these presentations, and His Royal Highness promised to send speeches in reply as soon as he could find time to write them. Perhaps his heart was too full for utterance; or it

CAMERON'S SPECIAL STEAM PUMP.

THE TORREY FESTIVAL.—On the 20th of December last, the Botanical Club of New York celebrated the fifteenth anniversary of the completion of Dr. John Torrey's "catalogue of the plants growing spontaneously within thirty miles of the city of New York," by a supper at the Astor House. Invitations were issued to all those who had been prominent in the study of American botany. Each guest had a sprig of *Torreya* in his button hole. After supper, Prof. Thurber gave a resumé of the progress of the science in this country, closing with a handsome tribute to Dr. Torrey, the guest of the evening. Dr. T. replied feelingly to the demonstration. Several other gentlemen followed with remarks, and several letters were read from noted botanists who were unable to be present. Among these letters was one from the venerable Dr. Jacob Bigelow, of Boston, now the oldest American botanist living. He closes thus: "Although if a scientific section of my trunk were now to be made, it might exhibit about four-score annual circles, yet I am happy to state, that the ligneous fibers appear thus far to do their duty, and the sap vessels to transmit their contents; and I confidently trust that on no occasion will my botanical friends find me to be hollow-hearted."

THE AMERICAN NATURALIST.—The March number of this magazine commences the second volume. It will hereafter be issued as a publication of the Peabody Academy of Science. The munificent donation of George Peabody, of one hundred and forty thousand dollars "for the promotion of science and useful knowledge in the County of Essex,"—in which county he was born, has been applied by the Board of Trustees as he directed. The building known as the "East India Marine Hall," in Salem, has been purchased. By arrangements made with the East India Marine Society and the Essex Institute, the valuable museum of the former, and the scientific collection of the latter, will be brought together in that Hall. The Peabody Academy of Science, under which name the Trustees are to be incorporated, will therefore have, at the outset, a museum which will, in some respects, be unequalled in this country. The *Naturalist* promises to take high rank among publications of the kind. The present number contains several interesting articles,—and its typographical execution is in the highest style of the art.

lishment of the New York Steam Engine Works. The smallest size of this pump is No. 0, which has a steam cylinder 3½ inches diameter, and pump 1¼ inches diameter; this, and the three next sizes larger, are mostly used for feeding boilers, for which purpose they are highly recommended. We are informed that they are extensively used in the East, and in Cuba; and that they have also been introduced into the English market with great success, as learned through the medium of notices in *Engineering* and the *London Engineer*. The pump is described in the *American Artisan* of Sept. 27th, 1865, as follows: "This pump is remarkable for its compactness and simplicity, its parts are few, strong and very plain, the operation is such that there is not an atom of steam used beyond what is necessary to move it. There is no dead counter to the pump; it will start from any point. The pump cylinder is fitted with a piston and four valves of generous proportions. The interior of the cylinder is so arranged as to

breech-loading guns, a recent trial of which, according to the *Transcript*, of that city, in the presence of experts, was pronounced far superior to any now in use. The advantages over any other cartridges are, that it is discharged by an ordinary percussion cap, and may be as readily loaded with powder, shot and wads as any ordinary muzzle loader—while the cartridges in use for breech-loaders require machinery. The chamber used for Davis' cartridge will not wear out, while those now in use cannot be used more than three or four times. Davis ought, adds the *Transcript*, to have a patent on his invention.

THE EVEN SECTIONS.—The Register of the Land Office in this city has received a dispatch from Joseph L. Wilson, Commissioner of the Land Office at Washington, announcing that the even sections of land along the line of the Central Pacific and Western Pacific Railroads have been restored and are now open to preemption and homestead settlers.

may be, that His Royal Highness couldn't possibly stop just then to make speeches. Toasts were drank, cheers were given, handkerchiefs were waved,—for there are fair hands in Australia,—and everybody was delighted.

DR. LIVINGSTONE.—A London telegram dated April 8th, is as follows: All doubts as to the safety of Dr. Livingstone are dispelled. Sir Roderick Murchison to-day received a letter from the distinguished traveler, which came via Zanzibar. Dr. Livingstone writes that he is in good health. His journey of exploration has been successful, and he will soon return to England.

PATENT OFFICE DELAYS.—Persons who have met with unusual delays in securing patents, may take heart from the following, which we give on the authority of an Eastern exchange: Nathan Parish, of Kalamazoo, Michigan, applied for a patent for a fan-blower twenty-five years ago. He obtained it last month.

[Written for the Mining and Scientific Press.]

Economy of Fuel, by the Expansion of Steam.

EDITORS MINING AND SCIENTIFIC PRESS: Having seen various communications and journalistic statements relating to the expensive trials recently made in this country, having reference to proving the often reiterated records of engineers, from Watt's era to the present hour, I have thought that it may interest many of your readers to know some of the more elaborate, exhaustive and impartial methods adopted to this end in the "old country," for establishing the full advantages that are derived from the expansion of steam. I do not deny that comparative trials are sometimes essential for particular purposes, to ascertain how far it can be beneficially carried for peculiar requirements under various circumstances, but such trial as it seems to have had in the U. S. Navy is most preposterous, carrying as it does a remnant of barbarism from a country whose inhabitants are speaking and recording facts in the same language. Repeating experiments in such a manner, regardless of the valuable tests of the past age, is indeed expensive analogism; as, after the whole oceanic steam navy had been fitted with non-expansive machines, these experiments were commenced to reestablish a principle, which all experienced men knew before the vessels were built; and reminds us of those short-sighted miners, so prone to erect expensive, full-sized mills or smelting works, who discover too late that they have supplanted the mining engineer, and the model pan or crucible, and must pay most extravagantly for such experience; yet such victims are legion.

In the following remarks I advocate expansion from a practical basis, and although I prefer separate expansion valves for all cases of slow travel, there are numerous quick-traveling, non-condensing, (locomotive, sawing, milling and factory) engines, that are not benefited by the extra valve, as an approximately correct expansion can be sufficiently attained by the single D "lapped" slide, favored by the quick travel of piston, intervening the initial pressure and the closing of the slide passage, under the "wire drawing" or restrictive action of governor valve.

The most systematic and reliable trials ever instituted, and consequently valuable data, have been obtained from the County of Cornwall, England; in the first place, from the system of competitive methods; secondly, it has been the greatest field for consecutive developments of economy for a century; perfected as it has been by Trevithick, Wolf, Hornblower, Sims, and Groze; as well as the living practitioners of the present day; and lastly, its manufacturers command world-wide names, having made the largest steam engines that ever worked, and those the most economical at their various duties.

The engines made to drain the water from the Harlam Lake, Holland, were 144 inches (12 ft) diameter of cylinder, and each engine worked thirteen levers, that diverged from the piston cap through apertures in a round-house, each lever being connected to a 60-inch pump, making eleven strokes per minute of ten feet in length, thus elevating in the aggregate effect, a column of water (10x11x13) 1,430 feet high by five feet in diameter, per minute. The lake was very successfully drained by three such engines, which were erected twenty-four years ago, and the Messrs. Harvey & Co. of Hayle Foundry, could have made, even at that time, a 200-inch engine if required. This firm has been supplying machinery for pumping, hoisting, milling, crushing, and manipulation in all phases for the extraction of base and precious metals, to all countries excepting the United States of America; but strange as it may be, I have not heard of or seen a single Cornish pumping engine in this country, or an engine embodying its advantages.

The Cornish patrons have elevated the mechanical engineer to a separate profession; he designs, draws, supervises the manufacture and the erection of all machinery, and visits each mine periodically, to see that it is kept in good order, and that the men and machines are doing their duty; he may superintend as many mines as he can obtain orders for, so that his interests are enhanced by their better performance. These causes work out good effects, as the makers are controlled and also interested in making good engines to compete with other firms in the excellent testings that are applied by a third party, who has an umpire's duty to perform for the public, in the following manner: As soon as the new engine is ready, he supplies and fixes an instrument* on the engine to record the number of strokes made during the month, the box being securely locked until the time expires. He then calculates the work performed during this period, and publishes the comparative statements in a circular for this purpose. By these means the most positive results are obtained, and such progression and superior economy that the Cornish engines have advanced from the performance of Watt's engine, where twenty-three millions of pounds had been lifted one foot high by a bushel of Welch coals, (\$4 pounds) to the modern duty of 110 millions, and secured the supply of engines from that county, as erected by its engineers, even to the water works of the great cities, where the local makers still fail to secure similar results. These advantages are more particularly derived from expansion of steam, extra clothing to prevent radiation, sufficiently large boilers, and slow combustion, which are settled facts in the history of the steam engine. The expansion is varied by cutting off, at from one-tenth to three-fourths of the stroke, depending on the load, description of work, etc., taking its position between absolute safety and economy. The engine-drivers are fully aware that the movement of the expansion slide, up or down, increases or decreases the fuel accordingly. The next series of experiments were conducted in a new field of engineering, for testing its value on the locomotives of the Great Western Railway, (London to Bristol) and were intended to prove if sufficient practical economy could not be obtained by the (then new) "lapped slide" valves; by diminishing the lap on the exhaust as it was increased on the steam side, to its practical limit, still producing a fair diagram of expansion from $\frac{1}{4}$ steam through the remaining $\frac{3}{4}$ of the stroke, and showing no injurious defects at the entering or departing angles; this has proven the maximum for tractional economy, although in some cases of light draught the effect has been still increased by the varied position of the ordinary slot-link, reversing motion; and separate cut-offs are therefore discarded for quick traveling, non-condensing engines; the more obvious reasons being complication, weight, friction, and wear and tear of the quick traveling, self-carrying railway engine.

Then followed the slow traveling, red-taped paraphernalia harness of the British Navy, (some twenty years ago) urged as they had been by qualified engineers, who had attached temporary fittings for the purpose of cutting off by the ordinary throttle valve, (in vessels that had insufficient boiler capacity for supplying the engines with full pressure of steam) and fully demonstrated the economy of expansion, by the vessel running faster per log line and log book than she had ever done under what had been erroneously called full power.

Full trials were now ordered, and separate expansion valves resulted. The examinations were wonderfully assisted by the recordings of the indicator's* pencil curve, traced on sheets that had to be sent to the Admiralty for the superintending engineer's perusal, as an important part of the engine log book; by comparing which with the ship's log, the pressure of boilers under non-expansion could be compared with expansive action, and corresponding speeds examined for all vessels, just as well at home as at sea; and these results having been noted, this eminently qualified engineer, (Thomas Lloyd) recommended the Admiralty to educate the commanding officers to these advantages, in long cruises, by using less fuel and economizing by expansion, as far as their duties permitted. The result of twenty years' records has been, that no modern engine is now made for H. M. S. Navy, with even a common slide, to carry steam the whole stroke; as they are all "lapped" to carry about $\frac{1}{4}$, and have separate expansion valves to cut off at from $\frac{1}{4}$ to $\frac{3}{4}$, so that the grades are so fitted for all circumstances, that the steam can be kept at full pressure and the feed and brine be always regular in their actions.

Let us steamboat proprietor delay in ob-

taining expansive action; and if a trial is still necessary, it can be made by discarding or "blowing off" one boiler, and working with the remainder on a cruise through the whole watches of firemen, and noting the coals consumed and the distance run with expansion from the full pressure, and also under the greatest pressure they can get without the expansion, or by having reference to those who have used both, they will find an immense advantage, more particularly in long voyages.

J. S. PHILLIPS, Mining Engineer.
San Francisco, April 2d, 1868.

* Watt was the inventor of the counter, indicator and expansion valve.

The Sugar Maple.

MESSRS. EDITORS:—In an article published in your issue of March 28th, entitled "Maple Sugar," some facts in regard to the culture and habits of the maple tree are desired. As a rule, the tree does not thrive away from the first line—that is, from those latitudes and altitudes where there is no frost. Moreover, observation proves it to be a tree that flourishes best in moist, rocky glades, and on hillsides. In traveling westward across the continent, the maple diminishes in size until we arrive west of Great Salt Lake. The last specimens of the tree I recollect to have seen in crossing the Plains, were in Rush Valley, or rather in the steep mountain cañons that open into that valley on the east; the largest of them seldom exceeded a few inches in diameter, and they were entirely confined to the immediate vicinity of the water courses. They grew in dense, impenetrable thickets, and to an average size of about one and a quarter inches diameter. In every other respect the tree was identical with the hard-eyed maple of the Eastern States. It is my impression, that the cultivation of the tree could not be made profitable in the valleys of this State, except at such altitudes as would have at least three months of frost and snow, and then only on northerly slopes. The flow of sap in such quantities as to make it profitable, also depends upon the frost. It is always observed in those regions where the manufacture of the sugar is carried on, that as soon as the spring is so far advanced that it does not freeze at night, the flow ceases to be in sufficient quantity to be worth gathering; and during the sugar season, which never extends over more than six weeks, only those days which follow frosty nights are counted on.

F. M. SHAW.

SAN FRANCISCO, March 31st, 1868.

Since the publication of the communication above referred to, we have been told that the tree from which sugar is made in the Southern States, is quite different from the sugar tree of the Northern States; and that the sugar produced therefrom is quite dissimilar in taste from the maple sugar produced in New York and the New England States. Can any one furnish any definite information with regard to that point?

ENGLISH CAPITALISTS WAKING UP.—A communication to the London Mining Journal, Feb. 8th, has the following: "The accounts of the great gold and silver lodes that traverse the Sierra Nevada, show that the mere surface workings, in five or six years, have sufficed to build cities of 15,000 inhabitants, and to establish intercommunication equal to many old-established provinces. Seeing the great riches of those lodes, it is not to be wondered at that capitalists are beginning to prick up their ears, and to talk of giving those marvellous El Dorados a fair trial; and, after the present apathy has passed away, we need not be surprised at seeing a goodly portion of our mining capital passing westward to those hitherto unknown but evidently splendid fields of enterprise."

SOLAR ECLIPSE IN 1868.—A scientific expedition is in preparation for the purpose of taking observations of the eclipse of the sun, which will take place during the present year. A station has been chosen situated in the Himalaya mountains, at an elevation of 7,000 feet above the level of the sea, in order to escape the clouds.

THE AIR-TREATMENT OF WINE.—MONS. R. d'Heureuse, the patentee of the new process by which new wine is ripened in a few weeks, instead of, as in the old method, years, gives us the following resume of his method. He says:

In all "must" are certain nitrogenous substances, the cause of fermentation, if called into action by some impulse. The contact with air and the germs of fermentation therein constituting the impulse, causes in "must" the violent fermentation—generally termed "the fermentation"—which eliminates a portion of the deleterious substances by oxidation in shape of yeast. To prevent later fermentation and diseases of the wine inherent therein, all the nitrogenous substances have to be eliminated. This can be done slowly, tediously, expensively and imperfectly, by frequently drawing the wine from cask to cask for years, or it may be done in a few weeks, thoroughly, easily and economically by impelling air into the "must" or young wine. The air it is, which in either case acts, oxidizing and eliminating the nitrogenous substances, and the wine is constant and sound only, when free from all these substances, which also carry with them all that had or earthy taste which vitiates nearly all American wines.

An air-pump is used by M. d'Heureuse for the purpose. In some cases it is desirable that the air be previously heated. The heater has a pipe and fanet, and the heated air may be mingled with that of ordinary temperature at will in a reservoir arranged for the purpose.

From this the air is passed through a cotton filter of simple construction and then conducted through some pipe or rubber hose to which a perforated mouth-piece of tin, copper or gutta percha is attached. This mouth-piece, mostly in shape of a pipe or pipes to suit the vat, is sunk to the bottom of the ferment-vat, and requires frequent cleaning from anything adhering to prevent souring.

Air being the necessary agent for fermentation, the impelling of it into the "must," is commenced at once. A slow current of air will generally prove sufficient. The temperature of the air to be kept low as a general thing; only exceptional cases may require it exceeding 70° F.—55° to 65° to be considered the average.

It is impossible here to lay down a general rule for the duration and quantity of the impelled air; it depends on the kind of "must," the weather and locality. However, it is certain that a deviation from the precise quantity of air, for the production of the very best wine—will be of less injurious consequence to the product than the incorrect guess—the word is used advisedly—as to the termination of the usual fermentation. It will also be preferable, toward the end of the process, to impel the air not continually, but to allow some intervals, during which the manner of clarification will permit an accurate judgment, whether the process is finished or not.

By this plan, it is claimed, a given quantity of wine may be worked with a smaller number of vats and in far less time than by the usual method. The losses by various accidents which, when the time is prolonged are liable to occur, are a yearly offset against the cost of pump-apparatus, which will last for years.

It was formerly supposed that air should be excluded from wine; and this was done in the face of the fact known to all, that it was improved by occasional changing from cask to cask. About 25 years ago, Liebig proposed that the casks be left open. This did not answer the purpose, because the air came in contact with the surface only of the wine. Mons. d'H. says that upon the first announcement of his plan, it met with no encouragement. He has now an ally in Mr. C. H. Frings, a well known German expert, who gives it as his opinion that this method is the only one suited for American wines. The patentee considers the method as adapted also to the treatment of cider, beer, and all fermented liquors.

PERPETUAL MOTION.—A Petersburg, Virginia, man has discovered perpetual motion at last. The *Index* describes the arrangement in full. It is to be patented at once. Mr. Wright, the inventor, has been occupied eleven years upon it, but has finally succeeded in solving the problem which so many wrong-headed men have puzzled themselves with. Only he hasn't.

Mechanical.

THE STEEL QUESTION.—Under this head, the *London Mining Journal* has an article from which we extract the following:—"Makers of steel, who have hitherto been dependent upon the crucible process, and who in that process have made large sums of money, are now beginning to look about them for a method by which metal can be obtained in larger quantities, in shorter time, and at less cost than by the old method. They are not prepared to take up the Bessemer patent, because they believe in the possibility of making steel in a much less cumbersome fashion. They feel that the process they seek must not be dependent upon the best ores; but, above all, that they desire to avoid the re-heating. Steel must be made direct from the furnace in which the ore is smelted. Experiments are being made with this view, and approaches to perfection are being made every week. The science of chemistry is now being applied to the production of iron and steel to an extent not hitherto dreamt of. Up to this time chemists have not had any experience in dealing with huge quantities, but such a laboratory as is now supplied at some of the great iron works in the Cleveland and Ulverstone districts is enabling them to arrive at results of a more practical character than those which they thought they had arrived at in their tiny experiments. No ironmaster who is moving with the times now dreams of making experiments without the assistance of the chemist, and chemists are now attached to all the great steel works. The results already arrived at would seem to point to the conclusion that wherever ore is most abundant and fitted for making iron, there, too, steel will be produced most economically and successfully."

HISTORY OF A BESSEMER STEEL RAIL.—Robert Mushet gives the following history of a steel rail: "In the early part of the year 1857 a steel bloom was made by melting in crucibles Bessemer metal with spiegeleisen. This bloom was rolled into a double-headed rail, and in the spring of 1857 it was laid down at Derby station. On the 21st of December, 1867, ten years and six months after it had been laid down, it was reported to be apparently little the worse for wear. Now the wear amounted to, on an average, 250 trains passing over it daily, and a like number of transits of engines and tenders. Reckoning now the weight of each train at 100 tons average, and that of engines and tenders at 20 tons, we have an amount of 30,000 tons per diem passing over this rail, and this continued for, say 300 days per annum, 10½ years, gives a total of 94,500,000 tons. Now on the Canadian railways the iron rails are worn out by a traffic ranging from four millions to thirty millions of tons, according to the quality of the iron rails. The Derby rail, therefore, of Bessemer steel, has already sustained more than three times the amount of traffic which suffices to destroy the best iron rails, and, in spite of this, it is still 'apparently little the worse for wear.' The opponents of steel rails will argue, no doubt, that this rail is an exception, and was better than other Bessemer steel rails, because the metal was remelted. Such, however, is not the fact, for steel is always more or less deteriorated by remelting; and the rail ends from Bessemer steel rails, made at Crewe, and therefore of course, the rails themselves are of as good and as durable a quality of steel as this Derby rail."

FIRST NEW ENGLAND IRON WORKS.—In 1637, bog iron ore was discovered in Lynn, Mass., and the first attempt to manufacture iron was made in that town. In 1643 a company was formed, called the "Company of Undertakers for the Iron Works;" its object was the smelting, forging and refining of iron. The General Court granted it the exclusive right to make iron, for twenty-one years, provided that they made, after two years, sufficient iron for the country's use. Heaps of scoriae are still visible at the site of the works. They were finally abandoned about a century after their commencement.

THE NEW ENGLISH IRON-CLAD "HERCULES."—The English are backing down squarely in regard to their iron-clads. The new monster, the *Hercules*, recently launched, is the largest and most heavily armored broadside ship in existence; but it is said that she can only carry three days' coal. Nobody seems to have any faith in her. The *London Times* now comes out flatly in favor of the American turret system, and calls upon the Admiralty to build scores of such vessels.

FRICTION OF STEAM ENGINES.—That steam engines never give in a useful form all the power actually expended in impelling their pistons is a patent fact; but with this knowledge it may be said that all information on the question begins and ends. There are no published data representing the results of experiments which possess much value. It is not easy to say why engineers, manufacturers, and, indeed, employers of steam power generally, have manifested an utter want of curiosity as to the amount of power actually obtained from steam engines. The real importance of the subject is overlooked. One is satisfied if his engine burns not more than 3¼ pounds of coal per indicated horse-power per hour, and looks down a good deal on his neighbor's which burns, perhaps, four pounds of coal in doing apparently the same work; forgetting that the indicator cannot measure useful effect, and that it is quite possible that the engine burning most coal is really more economical than that which burns least, when the work done is expressed in terms of useful effect and not as defined by indicator diagrams.

After a careful study of the question we have come to the conclusion that but three things in connection with it appear to be certain. The first is, no one knows much about the matter; the second is, that the power wasted by engines is much greater than is commonly supposed; and the third is that this result is sometimes due to very small imperfections in workmanship and design. Twisting strains, or badly fitting surfaces may cause an incredible amount of frictional resistance. We have heard of an instance in which a pair of screw engines required just half the pressure to drive them at their normal velocity without the screw that sufficed to propel the ship at her highest attainable rate. That is to say, the engines consumed in overcoming their own friction, 50 per cent. of their total power. This result, no doubt, was due to the fact that the engines were put on board while the ship was yot on the stocks. When floated she altered her shape slightly, and threw a strain on the rigid shaft. Such a blunder is frequently committed.—*Engineer*.

PUDDLED STEEL FOR RAILS.—The *Engineer* calls the attention of iron-masters to puddled steel for rails, as a material which, standing between iron and steel, is probably superior to all others. It is little more than a very fine grained, ductile, homogeneous iron. It is durable and cheap. We quote from the article: The perfection of a rail would be one with a very hard head and a fibrous foot. Given the fibrous foot, the head can scarcely be too hard,—cannot possibly be too homogeneous and fine grained. Such a rail could only be made by welding steel top plates on to iron webs and feet. The experiment has been tried with Bessemer metal, totally without success unless at least fifty per cent. of steel was present, so as to throw the weld into the web. Puddled steel, on the contrary, will weld perfectly to iron, although forming not more than 12.5 per cent. of the whole mass. We must go to Germany to learn of what these compound rails are capable. The first rails of the kind were laid at Hamm, on the Cologne and Minden Railway, in February, 1854. Iron rails were found to last barely two years at this junction, the annual traffic through which can scarcely be less than fifty millions of tons. The compound rails weighed but fifty-six pounds to the yard, and the steel used was but ¾ inches thick. After eleven years' use, these rails scarcely showed any marks of wear, except on the inner sides of the upper tables, and were still, of course, in perfectly good condition for service.

ALUMINUM BRONZE IN MACHINERY.—M. Hulot, of the French Imperial Mint, has called attention to the fact that the perforating tools employed in the division of postage stamps are rapidly blunted by the gum used to render the stamp adhesive. Indeed, so rapidly is the effect produced, that after a few hours' work the tools, instead of piercing the paper, only crush it. M. Hulot replaces the steel by aluminum bronze at ten per cent., and the new tool, striking 126,000 blows per day, or making 180,000,000 holes, has worked for several months without requiring repairs.

Aluminum bronze does not unite freely with solder by the old process; but if we take equal quantities of zinc-amalgam and common solder, aluminum bronze can be admirably soldered together by it. This solder becomes better again, if it is alloyed with twice or thrice its weight of tin. Thus there are three excellent solders—1st, solder with half its weight of amalgam; 2d, with a fourth; 3d, with an eighth.—*Science Review*.

Scientific Miscellany.

LENSES OF ROCK CRYSTAL AND TOPAZ FOR PHOTOGRAPHIC USE.—A. Claudet, F. R. S., acting upon a suggestion of Sir David Brewster, made some experiments with lenses of topaz, etc., which he thus details:

I tried a lens of rock crystal, non-achromatic and simply double convex, such as those used for common spectacles. I operated with an aperture of about half an inch; but, the lens being non-achromatic, I had to operate with the chemical rays, which by previous experiments I had found to be situated twenty-four inches behind the plane, giving a correct visual focus of a person placed at twelve feet before the camera. The result was a very sharp and correct portrait, every plane of the figure being equally well defined.

Sir David Brewster was pleased with the success of this experiment, and considering that it was partly due to the small dispersive power of rock crystal, suggested that I should now try a lens of topaz, the dispersive power of which is still less than that of rock crystal.

Accordingly I had a lens of topaz made, with the curves as six to seven, giving less amount of spherical aberration. The result was still more surprisingly beautiful than that obtained with the double convex rock crystal lens.

I must not omit to remark that the portraits I have taken by this means required a sitting five or six times longer than when we operate with quick double achromatic lenses of short focus, such as those which are generally employed for taking portraits; so that in practice, for portraits, small topaz or rock crystal lenses would be but slightly available. But, as was remarked by Sir David Brewster on seeing the result of the experiment, photographers have only to endeavor to increase the sensitiveness of their preparation; and there is no reason why a sufficient degree of sensitiveness could not be attained, by which photographers would operate with lenses giving no distortion and having a very long range of definition.

ANIMAL ELECTRICITY.—This term was coined by Galvani to designate what seemed to him a peculiar modification of electricity, seen only in animals,—the existence of which he believed to be proved by his celebrated frog-leg experiment. But it is now established that this is due to the same cause as the electricity of the battery, viz., chemical decomposition. The *Engineer* says: Unless chemical action can be set up there is nothing to indicate the presence of that vital muscular agency which the first experiments in connection with the subject led the older philosophers to insist upon and adhere to. The animal current, which they so fondly believed in, is simply an ordinary electrical current produced chemically by the contact of a saline solution with animal matter. Adopting this view, it is easy to perceive that the development of animal electricity, in invalids and diseased organs, is solely the consequence of chemical decomposition. Thus, for instance, the mucous membrane of the mouth becomes electrical in patients suffering under disease of the stomach or digestive organs. All animal excretions are electrical, and urine possesses this property in so remarkable a degree as to cause the needle of a galvanometer to make a complete revolution on the dial. The electricity of fishes results from an alkaline solution in the cells of the electrical organs. All the effects of animal electricity may therefore be regarded as closely resembling those of fermentation and putrefaction.

THE STONE AGE.—Professor Carl Vogt divides, as do Lartet and Christy, the Stone Age into two periods: the *Cave-bear epoch*, distinguished by large beasts of prey and pachydermata, rude flint implements, etc., and the *Reindeer period*, characterized by hammered stone weapons, artfully carved bones, a northern fauna, and human skulls, indicating a more intelligent race. An interesting article in the *American Naturalist* for March, suggests the possibility that the two races were cotemporaneous. The last named might have inhabited the valleys near the Alps and Pyrenees; while the other may have lived in England, Northern France and Germany. In this view, the supposed great length of the Stone Age is much reduced.

NEW RAPID TELEGRAPH.—The Abbé Moigno gives the *Journal of the Franklin Institute* a description of the new telegraph invented by M.M. Chaurapaignes and Lambrig, which we condense:—From 120 to 180 dispatches can be sent per hour by a single wire. A roller, moved by clock work, carries a metallic band which communicates with an electric battery. Upon this band the dispatch is written with "insulating ink." At the receiving end of the line, another roller carries, in like manner, a band of unsized paper, which passes over a smaller roller half immersed in a chemical liquor composed of water, nitrate of ammonia, and ferro-cyanide of potassium,—by which means it is sensitized. It is then changed in color by contact with a metallic point which corresponds with a similar one traversing the metallic band at the other end of the line.

SOLIDIFICATION OF BISMUTH.—Mr. Alfred Tribe has been experimenting with bismuth to ascertain the correctness of Prof. Tyndall's statement, that the anomalous expansion of water in the act of cooling below 4 degrees C., or 39.2 degrees F., is by no means an isolated instance of the kind, but that other bodies, and particularly molten bismuth, participate in this extraordinary property of expanding near the point of solidification. Mr. Tribe, in a paper read before the London Chemical Society, expresses the opinion that the analogy between water and bismuth is imperfect, since in the case of molten metal there is no perceptible range of temperature through which it expands on cooling. The act of solidification is itself accompanied by an increase of bulk, but there is no evidence of this expansion taking place prior to the act of crystallization.

"PHARAOH'S SERPENTS."—It is said that a harmless variety of this toy may be manufactured by taking the black liquor resulting from the purification of coal oil with sulphuric acid, and treating it with fuming nitric acid. The dark-colored resinous matter which swims on the surface is to be collected, washed and dried, when it forms a yellowish-brown mass, having about the consistency of sulphur which has been melted and poured into water. When this mass is ignited it undergoes a wonderful increase in bulk, so that a cylinder one inch long will give a snake about four feet in length.

DIETETIC SALT.—Dr. Lankester proposes to substitute for common salt, as a condiment, a preparation in which, in addition to the salt (chloride of sodium), other substances are combined in the proportion in which they exist in the human blood. His idea is, that as these are used as remedies in disease, they will act as preventives of disease when used habitually as food.

POROSITY OF CAST IRON.—Messieurs Deville and Troost have found by experiment that hydrogen, carbonic acid, and carbonic oxide actually pass through the walls of a cast iron stove at even a dull red heat. This is a strong argument against the use of such stoves, for carbonic oxide is a poisonous gas. Much of the discomfort arising from their use is probably due to this cause. Tile or soapstone stoves are preferable.

THE EMBRYO HEART.—Herr S. L. Schenck has published a paper on the physiology of the embryo. Examining the heart of the chick in the egg of the fowl, he discovered that its movements are, at first, quite independent of the central nervous system, and may be regarded as simple contractions of the protoplasm. When the heart is removed it still beats, if maintained at a temperature of from 34 degrees to 36 degrees Centigrade. The most powerful microscope fails to show any trace of nervous ganglia; hence, he concludes that the contractions of the heart are due simply to the action of the heart on the protoplasm.

ARTIFICIAL NERVE.—Prof. Wurtz, of the College of France, has succeeded, by a synthetic process, in forming a strong base, identical with that first obtained by Liebig in 1865, who subjected a crystallizable substance derived from the brain, and containing phosphorus and nitrogen, to the action of strong hyarta water.

California Academy of Sciences.

REGULAR MEETING.

MONDAY EVENING, April 6, 1868.

Dr. Thomas Bennett in the Chair. H. S. Craven, A. J. Bowie, Howard Crittenden, were elected resident members. Col. Ezekiel Jewett, of Utica, N. Y., was elected a corresponding member.

BUILDING SITE.

Dr. Stout, from Special Committee on building site, reported the failure of the application to obtain any portion of Yerha Buena Park for such purpose. The Board of Supervisors were opposed to it, and hence no application was made to the Legislature. He suggested the formation of a sinking fund to buy a lot. Some objections were urged to this on the ground of inadequacy of present income. Dr. Ayer proposed a special monthly contribution. Dr. Stout thought some mode of obtaining means should be agreed upon before the price of real estate became excessive. A purchase now would give the Academy the benefit of the advance in the price of land. The whole matter was finally referred to the Regular Committee.

AN INTERESTING FOSSIL.

Mr. Clayton called attention to some specimens of what he supposed to be a new family of corallines, taken from the Silver Peak Basin, in Nevada. One of them contained a new kind of trilobite, or at least one, the description of which he could not find in the books. He proceeded to describe the formation of the country in which these fossils were found.

SALT ROCKS.

Mr. Clayton then produced a specimen of salt rock, taken from the same locality, and stated it as his opinion that the origin of the salt found in Nevada was not, as was commonly supposed, by upheaval, but was to be found in saline rocks.

Dr. Ayer said this subject was one of great importance and interest. He had noticed that all the salt found in the Utah Basin was exceedingly pure chloride of sodium. He had been informed by the superintendent of the Geological Survey accompanying the overland railroad, that it was his opinion, that the salt almost always came from the decomposition of riolite rocks, and his discoveries had shown that rock dotted all over the basin. It was easily decomposed by the action of thermal springs, and being washed down, deposited the salt. There were thousands of acres of salt around them, and though it had often been dug to a depth of six or eight feet, its thickness was unknown. By analysis of this rock it was found to contain no magnesium or boracic acid, but only chloride of sodium.

Dr. Stout said that he had observed, in analyzing volcanic rocks, that potassa and sodium were liberated by decomposition. The quantity of these substances so liberated by volcanic rocks in that country must be immense, and it was not unlikely that this supplied the bulk of the salt found on this continent.

Dr. Cooper said that the most important evidence that no great salt sea ever existed in Utah, was that no marine fossils were found there. Had any great sea filled the Utah Valley at the time of the tertiary period, or more recently, marine fossils would have been found there. But, on the contrary, fresh water fossils had been discovered, and fresh water shells were found on the upper part of the Snake River and elsewhere, showing that large bodies of fresh water had existed there, but no salt water.

SPONGES—A VENUS' FLOWER BASKET.

Dr. Ayer called attention to a very beautiful specimen of the sponge family, donated by Mr. W. G. Sherman, together with some Indian weapons, both being from the Philippine Islands. He remarked that the sponge was variously ranked, as animal or vegetable. It evidently occupied a position between the two, but where the line was to be drawn it was impossible to say. It was at present, however, generally thought to be animal. The sponge had for its basis, horny, calcareous, or silicious substances, and was enveloped in a gelatinous or fleshy mass, which was the animal. The common sponge had a horny base; others had silicious bases, as this one; and if placed in the fire, and heated to a white heat, it would remain unchanged. Sponges were found in all seas, from the Arctic to the Tropic, and were in abundance on the coasts of New England and California. This one belonged to a genus first discovered on the coast of Great Britain, where there were some twenty-four genera. It was brought from the Philippine Islands, and was known

as "Venus' Flower Basket." It was a most beautiful specimen. It consisted of a series of little straight rods, forming a tube. This tube was woven all over with fine threads, that looked more like the work of man's hands than of nature. Each little thread resembled spun glass, but when placed under the microscope, every one was found to comprise a series of concentric layers. Outside of these were a number of little ridges, to give it strength. At the bottom was a mass of loose flocculent fibers, and it was probable that these were imbedded in the ooze or mud of the ocean where the animal dwelt.

A committee of five, consisting of Messrs. Stout, Logan, Yale, Ayer and Stearns, was appointed, on motion of Dr. Stout, to draw up a report on the subject of the abrupt and shabby discontinuance of the Geological Survey. Adjourned.

A Labor Exchange.

We are pleased to see that the long-talked-of idea of the establishment of a Labor Exchange in this city is about to take form and shape. A meeting of the friends of such a movement was held at the Merchants' Exchange, on Tuesday last, when the subject was freely and fully discussed, and a committee of four appointed to report at an adjourned meeting a plan for the organization of such an association. This committee reported at an adjourned meeting held at the Merchants' Exchange yesterday afternoon. The plan which was then proposed and accepted, adopts the title of "California Labor and Employment Exchange." The objects of the association are to collect information from all reliable sources as to where skilled and unskilled labor may be employed, and to place itself in communication with both employers and employes, and especially to assist the thousands of laborers who are constantly arriving in this State, in securing employment. It will also be made a part of the business of the association to aid emigrants with small means in purchasing farms, by collecting information with regard to the most available lands, and placing such men in contact with those who have desirable lands for sale. The expenses of the association are to be borne by voluntary contributions and fees for membership—\$10 being the amount to be paid to constitute a membership for one year. Reasonable fees are also to be taken from such persons as are definitely benefited by the association, and are able to pay; but no fee is to be charged to applicants as a condition of information. Notices of the objects and purposes of the association are to be distributed on all incoming steamers, so far as practicable.

The officers will consist of a President, Vice President, Treasurer, Secretary, and seven Trustees, to be elected by the members. The Mayor of the city, the President of the Chamber of Commerce, of the Mechanics' Institute, and of the San Francisco and British Benevolent Associations, are requested to act as Trustees, *ex-officio*—the Mayor of the city to act as President of the association. The business of the association is to be conducted by a committee of three, to be presided over by the President. A committee of three was appointed to solicit subscriptions for membership, with instructions to call a meeting of subscribers as soon as fifty shall have been obtained;—the same committee to report at that meeting the names of seven members to be voted for as trustees. This movement is a most important one, and it is to be hoped that a beginning so auspiciously made will be carried into a most successful and useful activity.

IMPROVED ERASER.—Mr. William H. Miles, brush manufacturer, No. 117 John street, N. Y., has patented a very convenient rubber eraser, which he is about supplying to the stationery trade. Short bristles are inserted in one end of the rubber, forming a stiff brush for cleaning the paper after rubbing. It will be found very serviceable to draughtsmen, students, and others who freely use the pencil.

New Patents and Inventions.

Under this heading we shall mention, from week to week, as occasion may demand, new and important inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

74,782.—FIRE-LIGHTER.—Levi H. Whitney, Vallejo, Cal.:

I claim, as an article of manufacture, a fire-lighter, constructed of the parts arranged substantially as described.

74,862.—STREET PAVEMENT.—Henry M. Stow, San Francisco, Cal.:

I claim a pavement, composed of tiers of wedge-shaped wooden blocks, driven into a foundation-bed of sand or earth, with spaces between said tiers packed with gravel, or sand and gravel, substantially as shown and described.

74,931.—COMBINATION OF LIFE-PRESERVING AND SWIMMING-APPARATUS.—Halvor Olsen, San Francisco, Cal.:

I claim the combined use and application of the floats, and the extended ribbed and webbed gloves and sandals, constructed and attached to the user, in the manner and for the purpose herein described and represented.

74,994.—SELF-LOADING BATTERY GUN.—I. J. Crammer, Vallicia, Cal.:

I claim, 1. The sash or frame R, provided with lugs for moving the slides S S, and constructed substantially as described, and for the purposes herein set forth.

2. The rock-shaft and frame Q, provided with teeth that move the sash or frame R, substantially as and for the purposes herein shown and described.

3. The construction of the lock for firing the volleys, consisting of the sliding bar J, and dog L, with the lug a, hammer M, and spring F2, substantially as herein shown and described.

4. The device by which the caps are placed upon the nipples, consisting of a combination of the spring E2, dog n, and lugs with the sliding bar S, substantially as herein shown and described.

5. The combination of the hopper O2 with the tubes p and plates t, lugs g, and sash R, operating substantially as and for the purposes herein shown and described.

6. The construction and arrangement of the wall S' in each powder-chamber, adjusted laterally by means of the set-screws to regulate the charge of powder, substantially as and for the purpose specified.

The aim of this invention is the construction of a gun with any number of chambers, from which the powder and ball are discharged from a cylinder which is fed with loose ammunition, and is so arranged that it is loaded automatically by gravitation, and discharges by volleys any number of single balls or cases of shot. The loading and firing may go on automatically without any reference to length of time, except from the overheating of the gun. And any number of cylinders from two to any higher number may be fired in volleys at each discharge. It is so constructed that each volley can be discharged simultaneously by the explosion of one cap. The machinery of the gun is encased in steel plate, and made bullet-proof against small arms. It rests upon a pivot which enables the gunner to direct his fire with as much care and precision as the most skillful can any ordinary small-arm.

It is so constructed that it may be placed upon a carriage and drawn by horses from place to place. It appears to be well adapted for use in fortifications, in case of an attack by storm, or on board of vessels or in any place where rapid firing may be desirable or necessary. It is claimed to be able to discharge 100 volleys per minute. A result giving any approximation to such a number must render it one of the most destructive weapons of war, in close fighting which has ever been invented. See editorial notice.

75,026.—CONSTRUCTION OF VEHICLES.—Geo. P. Kimball, San Francisco, Cal.:

I claim, 1. The combination of the perch A and jack P, with the bars J J and H H, substantially as described and for the purposes set forth.

2. The combination of the bar D, plate O, bolts I I, braces G, and perch A, substantially as described and for the purposes set forth.

3. The combination of the screw-plate C and nut C with eye-bolt S, substantially as described and for the purposes set forth.

75,084.—DRILL-SHARPENER.—Elisha W. Walton, Drytown, assignor to Joseph H. Atkinson, San Francisco, Cal.:

I claim the combination of the swage,

frame and die, in combination with a stirrup-lever and an eccentric, for the purposes specified, all constructed and arranged substantially as described and shown.

75,254.—IMPROVED BEDSTEAD FASTENING.

Bartbolome Essig, Sacramento, Cal.:

I claim the plate C, for attaching the side rail of a bedstead to the post, having an arm C, and oblique lug b, so as to be firmly secured to the foot by the tenon on the end rail, substantially as described.

And in combination with plate C, I claim the plate D, fastened to the side rail, having a lug or key, fitting into a slot or groove on the plate C, substantially as and for the purposes described.

The object of this invention is to provide an improved and reliable means of fastening the rails of bedsteads to the posts, so that they may be easily and quickly taken apart and put together, and, when put together, will be secure, and tend to keep the bedstead firm and solid, no amount of racking having a tendency to loosen the joints. By the means hereby employed, the necessity of making a mortise on each side of the post is avoided; consequently there is little danger of injuring the bedstead in putting it together or taking apart. By this device a bedstead may be taken apart and set up in a short time without the necessity of hammering, while each part of the fastening operating upon another, tends to hold the entire frame in place.

REISSUES.

61,576, dated Jan. 29, 1867; reissue 2,884.

HAY-KNIFE.—Philo O. Soper, San Francisco, Cal.:

I claim, 1. The construction of the blade B, substantially as described.

2. The hearing of the shank C, in connection with the angle given to the edge of the blade B, substantially as and for the purpose described.

3. The point A, substantially as and for the purposes above described.

RECENT INVENTIONS.

NEW PAN.—We have been shown, lately, a new device for grinding and amalgamating gold and silver ores, the invention of Mr. Wm. Hepburn of this place, which we think is destined to facilitate the reduction and amalgamation of ores to a great extent. The principles involved in the machinery are new in their application to this purpose. The shell or outside of the pan is the same as the ordinary one, and Mr. Hepburn says that he can apply his grinding motion to any of them now in use with little expense, but the grinding is done on the top of the muller plates and against the rim of the pan. The muller is made slightly conical and does not touch the bottom of the pan. On it are placed a number of rollers, enough to fill the whole circumference of the pan, but free to move around it. Motion being given to the muller the rollers are thrown out against the rim of the pan and revolve by their friction against it, and will crush the sand with a force equal to their weight, increased by the centrifugal force and to their motion around the central axis. In the mean time the muller is traveling faster than they are, and constantly dragging the sand under them, and it is being crushed by the weight of the rollers and their revolutions on their own axis. Mr. Hepburn has a pan in operation at Sutter Creek, Amador county, only sixteen inches in diameter with rollers three inches in diameter that is working forty pounds of hard quartz sifted through a screen of 3-16 mesh, and reducing it to a perfect pulp in less than three hours with about one dog power. Mr. Hepburn has made arrangements to place his mullers and rollers into a Wheeler pan at the Oneida mill, Amador county, and will run it against others of the same pattern now in the mill. This mode of applying the crushing is entirely new, although it involves a principle which inventors have for a long time been trying to put in practical operation. The new pan is cheaper, simpler, crushes faster and is less liable to get out of order than any hitherto offered to the public. Mr. Hepburn, the inventor and patentee, is one of the most skillful and ingenious machinists in the State, and we are glad that his labors have been crowned with success. Large numbers of the new pans will soon be in operation.—*Calaveras Chronicle*.

MR. LOCHER, of the Oroville Foundry and Machine Shop, has invented and made a model of an agricultural locomotive, and has applied for a patent for the same. In its present shape it is a steam plow, although a reaper, sawmill, or any other labor-saving machinery may be attached to it.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, March 28th: The Superintendent of the Morning Star Mine, after the strike into the ore, a week ago Thursday, went immediately to work preparing a station for taking out ore, so nothing further has yet transpired in regard to the amount of the deposit found.

Mr. N. Graff, Superintendent of the Tarshish mine at Monitor, is making a series of experiments to test the system of extraction by chlorination upon the ores of the Tarshish and that vicinity.

From lack of economy, in reduction of ores, it is estimated that the aggregate loss on the production of bullion in this country for the present year will reach the sum of \$225,000,000.

Mr. Pettis, the contractor, has added a track and car to his facilities for getting ahead. Three shifts of workmen are putting the thing along as fast as it is possible to be done.

Amador County.

Ledger, April 4th: Work will be resumed upon the Blue Jacket mine in a few days.

We were shown, last Wednesday, some as fine quartz as we ever looked at, taken from the bottom of the Coney & Bigelow shaft. It showed free gold running through it, and was completely studded with sulphurets. The vein from which this rock was taken is now 12 feet wide, and enlarges as they go down on it.

Alvinza Hayward, one of the oldest and most successful of Amador's quartz miners, has disposed of all his interests in this county, and left us.

Two or three weeks ago, we noticed that placer diggings had been discovered on the ranch of Mr. Bigelow, residing about three miles above here, on Jackson creek. That gentleman informs us that the claim still continues good—yielding \$8 per day to the hand for every day's work done on it.

The Coney & Bigelow mill, at this place, having had 10 additional stamps added to it, is now pounding away, everything working to a charm. They are running 16 of the stamps on rock taken from the Kennedy mine, and ten on rock from their own mine.

The chlorination works, at the Coney & Bigelow mill, will be put in operation again next week. They have a good quantity of sulphurets on hand.

Dispatch, April 4th: A few days since, a mineral was discovered in some decayed quartz situated in a gouge coursing along a vein of quartz from six to eight feet wide. After calcining this gouge, a metallic substance was obtained, which, on being tested by competent judges, was found to be silver. The site where the silver was found is on the southeast base of Butte Mountain, near the head of French Gulch. Since this discovery, some Portuguese have opened up a claim richer still, which had been prospected over a year since, but not knowing what mineral the rock contained, they consequently did not work it long. After seeing the product of the new discovery, they saw a similarity between theirs and that, so they immediately re-located, and are now engaged in opening up.

A placer mine north of Clinton, owned by Whitmore, Spagnoli & Pitcher, has been averaging as much as \$8 per day to the hand since it was opened. We had the pleasure of seeing one of the nuggets, which was as large as a quail's egg. It is now being worked night and day. Another claim, rather east of Clinton, owned by J. W. Hutchins & Co., has a very extensive surface sluiced off. It is a hank of some 20 ft. in depth, and has more or less gold all through it.

It is reported that the Mahoney mine has been sold for \$250,000.

The Butte Basin Co's claim is progressing finely. The shaft is now down over 180 feet from the platform on which the dirt is dumped. The last few feet has been hard ledge.

Philip and George Cleich, after sinking several feet on their vein, have struck rock of which six pounds yielded four ounces in gold. This would be a yield of 20,000 to the ton of rock.

Nearly, probably quite, 300 tons have been delivered to Coney & Bigelow for crushing, from the Kennedy mine, at an expense of \$1.10 per ton to the proprietors.

Butte County.

Marysville *Appeal*, April 5th: On Friday we were shown specimens of gold-bearing quartz from the ledge of James Andrews, which certainly contains 90 per cent. pure gold. The ledge is located some three miles east of Buffalo Ranch, in Butte County.

Calaveras County.

The Whisky Slide correspondent of the *Chronicle*, of April 4th, gives the following items: There are many good claims in this district, and they have been worked with decided success during the past winter. Antone, Rogers & Co., on Hynes' Gulch, are making from \$5 to \$8 per day. Pasqual, Noel & Co., on the same gulch, have made, on an average, \$5 per day to the man all winter. McIntire & Co's claim looks well, and they expect to clear \$8 per day to the hand. Mr. Laden showed me a nugget that weighed \$53, that was taken from his claim on Donley's Flat. This claim has proved to be one of the richest in the district. On Wet Gulch the miners are all doing well. Two men, Augustine and his partner, on Horse Power Gulch, cleaned up \$500 in less than one week. On Music Gulch, French Peter & Co. are doing well; they picked up two nuggets, the other day, worth \$102. There are other companies making fair wages.

Inyo County.

A correspondent of the *Esmeralda Union*, writing from Independence, Inyo Co., says: In the Inyo District some exceedingly rich gold-bearing ledges have been discovered, and one company is in successful operation, running two 12 ft. arastras by water power, on the Owens River, at the Bend City bridge. The arastras work about 2½ tons every 24 hours, which will yield \$50 per ton, the gold being remarkably fine for quartz gold. Some of the gold has been assayed and went \$19 per oz. Several other parties are now prospecting in the Inyo mountains and have found other ledges which look equally as well. The ledges range from 6 inches to 2½ ft. in thickness, and all well defined.

Another important discovery has been made in the Alhambra District, twelve miles south of this town. Thomas Passmore and some others have discovered quite rich placer mines in some of the ravines in the above named district, and have been engaged for some time past in digging a ditch to carry water for sluicing purposes. Prior to commencing the ditch they worked with rockers, and averaged to the hand \$6 per day of 6 hours. I have seen the gold taken from those diggings, and know it to be veritable placer gold, and have no doubt but what the diggings will prove more extensive than at present supposed. I have seen one piece or nugget of gold taken from these mines, worth \$14.

Dr. Delevan writes from Cerro Gordo to the *Virginia Enterprise*, of April 2d, as follows: Parties have already arrived in the camp from San Francisco, have secured mines, and are about erecting furnaces. Those who have thus become interested in the mines of the country are men of much experience in smelting silver ores. They will erect large and lasting furnaces. The clumsy little furnaces become so burned out after running 12 hours that it is necessary to allow them to cool off in order to repair them. The Doctor says a large amount of silver will be taken out of the mines in this vicinity during the coming summer.

A correspondent writes to the *Nevada Gazette*, of April 6th, from Cerro Gordo, as follows: The mines of this district are principally silver, and, in most cases, very rich, when compared with mines of other camps in this region of country. The ore from some assays as high as \$2,000 a ton, many of them averaging from \$500 to \$700 a ton; but, of course, there are others which are far inferior.

Kern County.

Havilah *Courier*, March 14th: The severity of the past winter has left its impress upon mining operations in this part of the country. Whilst active operations were necessarily impeded to no inconsiderable extent during the late rainy season, the disabilities under which miners have labored have not had a dispiriting effect.

The Burning Moscow shaft has been sunk about 70 ft., and something like 150 tons of excellent rock has been extracted. The mine was sold a few days since to Messrs. Hammel & Denker, of the Bella Union Hotel, Havilah, for \$10,000. The new proprietors intend to set to work energetically in developing the mine.

Mr. Kneadney's mill is going again after a temporary suspension, caused by injuries to the road leading from the mill to the mine.

The St John mine is doing very well.

The mill near town, known as the Hate mill, has been bought by Rogers, Keeney & Bridger, and is being removed to Sagedale for the use of their mine at that camp.

Mariposa County.

Gazette, April 3d: A colored man, known by the name of "Smithy," one day last week, was lucky enough to find a nugget in prospecting below town in the main creek. There is some quartz mixed with it. The

entire piece weighs \$72, and it is supposed that the yield of gold will be \$50.

Mail, April 6th: The mine and mill of the Onkes & Reese Co., continue to work to great profit. The mine is looking better than ever before. They are running a drift on the Blue Lead, and at a distance of 25 ft. from the shaft, the vein is enlarging, and measures at that point four ft. in width. The rock is very rich, the richest yet taken from the mine, and is regarded by experts as equal to any ore worked in any part of the State. Everything about the works is extremely favorable, and the company contemplate putting on an increased force at an early day.

It is reported that the Mariposa Co. will immediately commence operations on the Princeton mine and mill, having engaged the services of Mr. Rice, a well known and able engineer.

Nevada County.

Transcript, March 30th: The company which has for some time been prospecting the old Wagoner ledge, near the Half Mile House, after having run a tunnel and sunk a shaft, have found that the ledge prospects well, and the parties propose soon to erect hoisting works and open the ledge for work by means of an incline.

April 2d: The New York Hill Co. at Grass Valley, have increased the capacity of their mill to twenty stamps, and expected to start it up yesterday. The ore in this mine is looking first-rate.

April 3d: A French company is engaged in putting up extensive sulphuret works near Canada Hill, where sulphurets will be reduced by a new French process.

Gazette, April 1st: An immense slide occurred in the claims of Dr. Farnham, at Chalk Bluff, a week or ten days ago, filling up the drain tunnel and causing a suspension for a time of sluicing operations.

April 2d: A North San Juan correspondent writes: Some of our mining companies at this place and vicinity cleaned up last week and realized handsomely.

The celebrated Buckeye claims of Evans & Co. paid for the month's operation \$24, 750.

The Yuba claims at Manzanita, owned by Messrs. Whiting, Chiou & Co., realized, gross, about \$8,000. This was the first run made by that company since the completion of their tunnel, and they are as yet hardly in to their paying gravel.

The claims of Bowen & Morgan on San Juan Hill proper, realized to the owners, after a three weeks' run, nearly \$5,000.

The Golden Gate claims, also on San Juan Hill, cleaned up sufficiently well so as to divide among the owners about the same sum.

Grass Valley *National*, March 31st: The 20-stamp battery of the New York Co. will start into operation to-morrow.

Our custom mills are busily engaged in crushing rock from various leads near town and vicinity. At the Gold Hill mill we notice this morning rock from Seven-thirty ledge, near Deadman's Flat, in the vicinity of the Legal Tender Co's ledge; also rock from a ledge between Spring Hill and the Eureka mine; also rock from the North Star Co's claims being worked on shares; also rock from the Rising Sun lead, near Colfax, and waste dirt from Massachusetts Hill.

April 1st: The Moore & Taylor claim at Gold Run cleaned up lately, after a run of 15 days, \$8,008.

Grass Valley *Union*, March 31st: Chinamen seem to be the men who are most exercised about the mineral region being brought into the market. They are rustling to find friends who will swear out 40-acre tracts for them, and are generally posted about the way American men are managing the public lands.

April 5th: The Wisconsin mine is now being worked on the fourth level 300 feet deep, and shows beautifully in free gold and sulphurets.

Placer County.

Amhurst *Herald*, April 4th: Mr. J. J. Reed has shown us the gold taken from 100 pounds of quartz from the Morning Star claim on the Ben. Higgins place. The specimen will reach at least \$90 per ton.

Dutch Flat *Enquirer*, April 4th: The last lot of cement run through the Baker Bro's arastras, yielded at the rate of about \$13 per car load, or about \$26 per ton.

The Queen City are engaged in relaying their pipes and sluices preparatory to commencing to wash.

Water was turned into the Yuba Ditch this week for the first time during the present season.

The old Boston claim, after a run of 16 days cleaned up on Thursday 144 ounces of gold.

The Dutch Flat Co. cleaned up on Thursday last, after a run of 16 days, about \$3,000. They did not clean up the boxes in the tun-

nel, and it is estimated that nearly \$1,000 are in them.

The Chinamen are the only parties mining in and around Green Valley, on the north fork of the American River. We learn that they are taking out a considerable quantity of gold. The miners along the north fork are making preparations for a vigorous season's work.

On Friday, Messrs. Snyder & Deverly took from a single crevice in their claim in Humbug Cañon, 40 ounces of gold. The miners are working very briskly in this section, and are meeting with good success.

Stars and Stripes, April 2d: The following is from Gold Run: Moore & Taylor, after 15 days' washing, cleaned up \$6,200. The Gold Run claim owned by Kinder & Stewart, after a run of 19 days, cleaned up \$3,012. The Shannon Co., Barney Fitzpatrick, realized \$4,100 after 27 days' washing. A company is about to be organized for the purpose of running a tunnel from Cañon Creek so as to strike a deep channel from 100 to 200 feet below the present wash.

Plumas County.

Quincy *National*, March 21st: The quartz interest in and around Indian Valley, seems to be looking up. Judkins & Kellogg, at Round Valley, are crushing, and doing well. Bidwell's mill is running steady, and the results are far ahead of their expectations.

Mr. Padeu has recently discovered some rich ground in the vicinity of the old Mus-sac Gulch. The claims are extensive, and judging from the prospects, the company expect to make half an ounce to the hand per day.

Turner, Rice & Co. at Black Hawk, have about got their flumes completed, and will commence piping in a few days.

Messrs. Bachelder & Viets, the owners of the Green Mountain ledge, near Cherokee, are crushing some of the best paying quartz we have heard of. The average yield of their rock is \$37 per ton.

San Bernardino County.

Guardian, March 28th: The season for placer mining in this locality, having duly arrived—that is, when the ravines are supplied with water—we find our industrious classes are applying themselves to prospecting new fields of labor, or improving those already known and thoroughly tested.

Sierra County.

Downieville *Messenger*, March 21st: The Johnson ledge, near the Docile, is proving very rich.

The owners of the old New York claim, near Alleghany, recently found a quartz boulder which contained about \$1,000 worth of gold.

A small cave which took place in the Docile mine a few days since, brought to light about 1,500 worth of specimens.

Same, April 4th: A contract has been let to run 50 ft. of tunnel on the Wehe ledge, situated just east of town.

The miners engaged in working on this branch of the Yuba are taking out good pay. The prospect is that the present mining season will be a prosperous one.

Yuba County.

Marysville *Appeal*, April 5th: The Smartsville Consolidated Hydraulic Mining Co. have filed their certificate of incorporation, for the purpose of mining at Sucker Flat.

ARIZONA.

Prescott *Miner*, March 14th: Jackson McCrackin, of Walker's district, head of Lynx Creek, was in town during the week. He informed us that owing to mud and snow, the miners are unable to get quartz hauled to their arastras. As soon as teams can get around, several miners will start in to hauling and grinding ore.

All the quartz ledges now being worked upon in this vicinity, promise well. The placer miners continue to get good pay for their labor, and the utmost confidence is expressed in the ultimate success of our mines.

The copper mines on William's Fork, on the Colorado river, in Yuma county, this Territory, are, just now, yielding largely. There are nearly 200 men now employed by the Planet, Great Central, and Springfield companies, and next to Wickenburg, it is the liveliest camp in the Territory.

COLORADO.

Georgetown *Miner*, March 19th: Richard Symmons is now raising ore from the Parr lode. Work on the Elijah Hise lode was resumed last week. . . . The Baker Company shipped over 700 ozs. of silver bullion last week. . . . Mr. Tucker has purchased an interest in the Eclipse lode. . . . Parties are at work developing the Dunderburg lode on Brown Mountain. . . . Prospecting for silver lodes in Boulder county is being successfully prosecuted. . . . The New Boston tunnel has crossed the Sam Holmes lode, showing a crevice 10 ft. wide, and every indication

of a good vein.... The east shaft of the Hunkadorn lode is now down 50 feet and there are strong indications of a fine pocket of ore in the vicinity.... Johnson & Haskins have struck a promising lode in their tunnel and are now running a drift upon it. The crevice is six ft. wide.... Work on the Wm. Penn lode has been suspended for the present.

Preparations are making for actively working the Wm. B. Astor lode the coming season.... Messrs. Fisher & Fritz are actively working the Sonoma lode, on Griffith Mountain. They have at their store a fine specimen, about two ft. in length and 10 in. in thickness, of sulphuret and galena ore from this vein.... Work on the tunnel being driven into Columbia Mountain, is progressing favorably.

Geo. T. Clark & Co. have shipped this week, 877.96 ozs. of silver bullion, coin value \$997.75, currency value, \$1,297.16. This is from the works of Garrett, Martine & Co.

Central City Register, March 19th: The Ophir Co. are taking out about 14 cords of ore per week, and running 12 stamps upon second quality.

John D. Peregrine puts his 18-stamp mill in motion to-day upon the rich ores of the Kirk and Washoo lodes.

Messrs. Grant & Langhand sluiced out in two hours one day last week from their claims on South Clear Creek 37 pwts. of gold.... The proprietors of the Fairmont lode in Hunkil Gulch are going to commence work this week. More mining is to be done this year in Clear Creek county than during any preceding year.... The California Reduction Works turned out yesterday, from $4\frac{1}{2}$ tons of ore from the Terrible lode, Georgetown, \$1,200, coin value. The average was \$374.21 per ton.... Fiske & Abbott are running the Chicago mill, on Clear Creek, on ore from the Adeline lode.

Denver News, March 18th: On the counters of the First National Bank this morning, were two large bricks of silver weighing respectively 595 65-100 ozs. and 455 $\frac{1}{2}$ ozs., taken from ore from the Terrible lode near Georgetown by the California Reduction Works of Black Hawk.

A gentleman informed us last evening that gold had been discovered on the Greenhorn Creek, near Zan Hicklin's ranch.

During the past week the Denver branch mint has paid out nine bars of gold bullion valued at \$4,463.18 in coin.

Central City Herald, March 18th: John Remine showed us 15 ozs. of nice gold which he got from three cords of Pierce ore. The ore was crushed in Mr. Fiske's mill.

Mr. Kenyon has his desulphurizing furnace in order and running. He is working on ore from the Pewabic lode, Russell district.

The U. S. Banks lode is situated in the vicinity of the celebrated Hoosier lode. From $1\frac{1}{4}$ tons recently treated at the California Reduction Works, 178.70 ozs. of silver was obtained. The ore was not selected;

Garrott, Martine & Co. have taken a silver brick, weighing 179.90 oz. and valued at \$244, from one ton of ore from the Silver Eagle lode.

Warren Hussey & Co. shipped this week 404 ozs., currency value, \$9,000. Of this the Bobtail Co. 49 ozs., North Star 65 ozs., and the Briggs Co. 147 ozs. Geo. T. Clark & Co's shipments amount to \$7,000 currency.

We have seen a report of a run lately made on two or three tons of Young America ore by the California Reduction Works. The ore assayed between \$90 and \$100 per ton; the amount saved was at the rate of \$80 per ton. We have also seen a report from $4\frac{1}{2}$ tons of Terrible ore which yielded 1,536 ozs., coin value, \$1,290.62. The cost of treatment was \$600 in currency.

DACOTAH.

A correspondent of the Sweetwater Mines of March 21st, writing from California district, eight miles northeast of South Pass City, says: Notwithstanding the inclemency of the season a great deal of prospecting has been done. New discoveries are continually being made, both in gulch and quartz diggings. Messrs. Shively, Rice and Chace lately discovered and located a very fine ledge called the Kearsarge. It is three ft. in width and remarkably well defined. The same party located another ledge a short distance from the Kearsarge, running parallel with it, and supposed to be equally as good. Another lode was discovered by Mr. Bennett on the 25th of February, but he has not been able to do much as yet towards developing it. Enough work, however, has been done on it to demonstrate its being as rich as the Miners' Delight ledge. I have seen \$16.50 taken from 22 lbs. of its rock, worked by hand mortar process. Many new ledges have been recently located.

An Idaho paper says: Mr. N. W. Earl, who left Salmon last fall for Sweetwater, does not give a very flattering report of the country. After being there two months, he says as to its being a mining camp, he fails to see it in that light. He says the whole country was staked into leads, of which he does not entertain a very high opinion. There are no placer mines that have yet been discovered that will pay. Provisions of all kinds are \$1 per pound; flour \$35 per hundred. He sums up his opinion of the camp as follows: "To make a long story short, I wish I was back in Salmon diggings; I would then have some chance of making my board next season, and here, where I am, it looks rather slim."

IDAHO.

Owyhee Avalanche, March 28th: The news concerning the war on the mountain, is the same as that published in last week's Press under the heading of "War in Idaho." Later despatches state that the parties have withdrawn their forces, and agreed to submit their claims to the courts. — (Eds. Press.)

The Oro Fino Co. have struck another chimney of rich ore in their lower drift between the south and middle shafts. The ledge is about four ft. wide where this new strike was made. The ore is of a dark brown color, in many places tinged with green, and in almost any of it gold can be seen sticking out. It is thought that this chimney will yield a larger quantity of rich ore than was ever before found in one place in the mine. The quartz is being hauled to the Webfoot mill, which is pounding away night and day.

Wells, Fargo & Co's shipments of bullion from this place for the month of March, up to date, amounts to \$147,000, coin value.

The shaft on the Allison mine is down 110 ft. where the ledge is four ft. wide, all solid quartz.

The Boise Statesman tells of a late quartz discovery on P. J. Peffley's ranch, five or six miles up Cottonwood Cañon, in Ada county. A shaft ten feet deep and eight square has developed a ledge of $3\frac{1}{4}$ feet width, ore from which has assayed about \$145 per ton. A number of claims have been located, and the thing has created some excitement in Boise City and vicinity.

MONTANA.

Post, March 21st: From Sterling we have the following items: McAndrews, Wann & Co. have a gang of men at work on the western portion of the Boaz lode and the shaft is now 110 ft. deep, with a well defined crevice. The same company is prospecting on the Atlanta and other lodes with good results. Snyder & Co. are down 115 ft. on the Goleonda, and the indications are thus far very good. Crawford & Co. have a shaft 100 ft. deep on the Primrose. They sank 100 ft. without any quartz in sight, but perseverance was at last rewarded by a good vein and the quartz very rich. Russell Kearney & Co. are steadily at work on the Brookfield, and have a crevice about three ft. wide from which they are getting rock which looks remarkably well.

It is also reported that prospects as high as a dollar to the pan have been obtained on the recent discovery known as Daney's Bar, 12 miles from this city.

J. H. and W. D. Mitchell yesterday sent up from their arastra in Granite Gulch 71 ozs. of retort, principally gold. The run was made from Alameda rock, yielding at the rate of \$54 per ton. They are now crushing ore from the Black lode in Brown's Gulch, roasting the rock before reducing, and it is thought it will yield well. The Messrs. Mitchell have two water power arastras, capable of reducing two tons per day, and have done good service in proving the richness of several leads. The Brown's Gulch district contains a number of leads of good width and known richness.

Hussey, Dahler & Co. have received 52 ozs. of gold retort, valued at \$1,222 currency, the product of Wood's mill, at Bannack.

We saw last week in the office of Wells, Fargo & Co., a nice little silver brick which was on its way East as a specimen. It weighed 25.50 ozs., was .967 fine, and was valued at \$29.38. It was taken from 287 lbs. of ore out of the Van Timmons lode, in Flint Creek. One ton of the rock at the above rates would yield \$204.28.

The Boulder correspondent writes: Claims hardly deserving the attention of the prospector a few weeks ago are to-day high up in figures. Alexander Hamilton, alias "one of the Scotties," sold yesterday No. 3 below discovery in said gulch for \$650, to S. M. Wessels. Other claims have changed and are still changing hands. Boomerang Gulch apparently holds its own; work seems to make the main change in it. The gulch at the head, and one mile west of Muskrat, is still worked and prospected. Men of reliability, engaged in it, speak very highly of their prospects so far obtained.

About 22 miles from here, near the head of Boulder, rich diggings are reported.

Deer Lodge Independent, March 13th: The James Stuart mill, at Philipsburg, will soon close down for extensive repairs. It is the intention of the proprietors to put in an extra boiler and add 10 more stamps, making 20 in all. Mr. James Stuart informs the editor that the St. Louis & Montana Co. will resume operations at Argenta.

NEVADA.

Esmeralda.

Virginia Tresspass, April 4th: We learn from Mr. Mann, just in from Pine Grove, Wilson district, that mining is progressing most satisfactorily, and that a large amount of bullion will be dispatched thence in a few days. The Pioneer and Wilson's mill are running with a full supply of rock, which is said to be yielding more metal than ever before. In fact, everything in the region of the mines is looking extremely prosperous.

Reese River.

For about a month we have not received a copy of the Reese River Reveille. We are unable to give the reason, but presume that the fault is in the mail, as no paper has heretofore been more regular in its appearance upon our table than the Reveille. The following items from that paper of April 1st, we have clipped from the Tresspass:

Bonlt & Stetefeldt received to-day 6,100 ozs. of bullion for assaying.

Two bars of bullion arrived in this city yesterday from the mill of the Combination Co.

The mill of the Belmont Co. at Belmont was reopened on Monday last, and is again crushing ore.

There were reduced at the Keystone mill, and melted and assayed by J. R. Murphy during the week ending 31st of March, 20,194 ozs. of crude bullion from the Keystone mill since it was reopened, week before last. The product of bullion in this region was materially lessened by the closing of that fine mill for several months, and now that it has resumed work we may look for a large increase in the monthly shipments.

Silver Bend Reporter, March 28th: About the only company now here engaged in taking out ore is the El Dorado South. At the bottom of the incline, 130 ft. from the surface, a level has been run south along the lode. This is now completed a distance of 30 ft., and discloses an excellent quality of ore all the way, but at the extremity just reached, it exceeds anything yet found in the mine, and shows a large body of as rich ore as has ever been raised from any mine in this section. Upon this mine there has recently been discovered a splendid body of chloride ore upon the surface, about 200 ft. south from the main incline.

Prof. Vincent, while here a few weeks since for the purpose of examining and reporting upon the mines of the Belmont Co. in the interest of London capitalists, selected about a ton of ore from the dump of the Transylvania for the purpose of testing its yield by a perfect process of working. We learn by the Reveille that the ore was reduced at the Keystone mill, and gave a pulp assay of \$392 of silver per ton. The lot of ore was not closely assorted, though it is not pretended that it is an average of the ledge.

Since our last issue Paxton & Co. have received for shipment 17,055 ozs. of refined bullion.

The Palmetto correspondent writes: Col. Oatherwood, of the New York and Silver Peak Co., has arrived and put a small force of hands at work on the Champion. The weather is yet too severe to permit vigorous work on our mines. The New York and the Silver Champion are the only two mines being worked at the present time. I am informed that the Kentucky and the Dickson Cos. will commence work on their mines early in the spring. The Kentucky mine presents a fine body of mineral of nearly six ft. in width from the surface to the bottom of the incline. The New York and Red Mountain Co., operating at Silver Peak, are progressing finely with their mill.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Enterprise, April 2d: About 70 men are employed on the Overman mine. Good ore continues to be taken from all parts of the mine. The amount raised for the month of March was 3,500 tons.

There was shipped from the Bank of California yesterday, three fine bars of bullion from the Occidental mine—value nearly \$5,850. This is about the usual yield of this mine, run as at present, and is the result of nine days work at a 23-ton mill.

April 3d: On the Gould & Curry ground some Mexican miners are at work. They have run a tunnel from a point a little

above B street, and are taking out some very fair ore from the ledge at a depth of 20 or 30 ft. below the surface. North of the old Savage hoisting works, on the Savage Co's ground, a shaft has been sunk, and paying ore is being taken out. Other parties are employed at various points, and upon the Chollar croppings work has been going on nearly all winter. There is a vast amount of good ore yet to be found in the croppings of the Comstock.

April 4th: Wells, Fargo & Co. shipped from their offices in this city and Gold Hill during the past week, 6,240 lbs. of assayed bullion, valued at \$175,781.30.

April 5th: The Gould & Curry Co. have received a supply of fuel, and are about to start up their hoisting works, which have lain idle for the past three months, though during this time the mine has been worked, the ore extracted being taken out through the lower tunnel in cars. They now have come-at-able in the mine, about 5,000 tons of ore.

The amount of bullion shipped from this State last month was, according to the books of Wells, Fargo & Co., and the most reliable estimates of the amounts shipped from outside districts, \$1,018,977.67.

The Savage Mining Co. intend putting in a line of telegraph wires from the top to the bottom of their main shaft.

OREGON.

Dalles Mountaineer, March 21st: On Elk Creek, a tributary of the John Day river, a number of ditches have just been completed, which will furnish the diggings with plenty of water the entire season.

The same paper of March 28th, says: The news from Canyon City is unimportant. Miners are at work in good spirits after the hard, cold winter.

The Walla Walla Statesman says: Reports from the new mining district (Shasta mines) continue favorable. Some 200 men wintered in the mines, and rumor has it, took out a large quantity of treasure. An old miner assures us that the district will afford profitable employment for 10,000 men. A large number of Walla Wallians have already left for the new diggings, and we hear of still larger numbers who are preparing to follow. A correspondent of the same paper indulges in quite a different strain. He says: "Coming down to stern reality, and looking facts in the face, the country is spotted, and good claims are few and far between. There are some rich, very rich claims here, and will probably pay thousands of dollars the coming season; but there are a thousand poor claims here; claims that will not pay 1,000 cts. clear of expenses, to one to the contrary. I have seen no one here yet willing to venture an opinion for or against. They are all doubtful, even including those who are called the 'lucky fellows.' In my opinion, this place is but a repetition of Big Bend and Lemhi; and will cause as much disappointment and broken men as either of those two places."

WASHINGTON.

Olympia Transcript, March 21st: From what we can learn, the gold diggings on the sand beach at Gray's Harbor will not justify a big stampede in that direction yet awhile. They are situated on the southern beach of the harbor, below John's river, from which it is supposed the gold has drifted, and up which river a party of miners are now prospecting. Some fine gold has been taken out on the beach, in small quantities, the dirt being washed by water raised by pumps, but we believe no large deposits have been found.

AERONAUTIC SOCIETY OF GREAT BRITAIN—A CHANCE FOR THE AVIATOR.—An exhibition is to be held in June next, at the Crystal Palace in London, for the display of apparatus connected with aeronautic science. Ample opportunity will be offered for experiments. The Shipwrecked Mariners' Society have offered a prize of £50 for the best form of kite, or other aerial arrangement for establishing a communication between a wreck and the shore, or between two vessels at sea. Those machines of the kind which compete for this prize, will be entered at the above named exhibition. Light engines, and other apparatus for aerial use, will also be entered. It is said that a number of scientific gentlemen in the United States have also formed a similar society, and will correspond, through a secretary, with this association, and will aid in the exhibition.

The best place to get a good pair of spectacles from plain glass to Brazilian pebble, is at Muller's, 205 Montgomery street.

Saturday Morning, April 11, 1868.

Notices to Correspondents.

SPECULATOR—Taking the elaborate tables made by the Hale & Norcross Co. as a guide, it appears that the loss of gold sustained in the extraction from its ore by the ordinary Washoe pan mode of amalgamation amounts to 14 per cent., and 48 per cent. of the silver, making an average of the two amounting to thirty-five per cent. In plainer words, of four tons of ore, containing \$100 worth of silver, or \$25 per ton, only \$52 are beneficated under the present system, \$13 per ton only being obtained in place of \$25;—an enormous loss, and would long ago have been investigated, owing to its startling magnitude, had it not been that this great deficiency is covered, in a large measure, by the larger percentage obtained from the gold present. As, however, with the exception of certain cases not of great magnitude, and susceptible of explanation, the proportion of gold in the ore decreases as the mine descends, as compared with the amount of silver, we cannot hold out any hope that the current average loss on beneficiating the silver, can ever be much reduced whilst the present system is adhered to. Any small improvement that may be possible on the pan mode, will inevitably be counterbalanced by the increasing amount of silver found in the ore as the mines are developed in depth, and so militate against any reduction of the average loss. A thousandth part of the money invested during the last six months, with the object of inflating or corraling certain stock, if judiciously expended, would most probably have put the market price of all gold and silver mining stocks greatly above the highest figures they ever obtained, with the exception of certain market corraling cases.

CORNU-ARGENTUM.—Horn, or chloride of silver can be reduced to the metallic form by melting with lead alone, but much more readily and with less loss, by adding a small amount of alkali, such as potash. Were it not for the loss just alluded to, chloride of silver void of earthy matters mixed with granulated lead, might at once be cupelled economically. In doing so, a part of the chloride, however, will inevitably sink into the cupel, before the lead decomposes the chloride, and another portion during the same interval, volatilizes. Berthier found that when one gramme of perfectly dry chloride of silver had been enveloped in ten grammes of leaf lead and placed on a cupel, that when submitted to heat, a perfect metallic bath was formed, which for several minutes appears dark and tarnished, which slowly becomes clearer, and after some time assumes the brilliancy of melted lead. It was found that when the fact last alluded to occurred, the clean button of lead remaining weighed 7.6 grammes, which, on being cupelled, was found to have lost 0.22g of silver, or nearly one-fourth, which had disappeared as above described.

BRIMSTONE.—San Luis Obispo.—Sulphur may be found in any geological formation. In Sicily it occurs in beds of blue clay, said to belong to the same geological formation with the gypsum beds of Paris, and, consequently, more recent than the cretaceous; in Swabia and Hungary it is found in veins traversing granite, and in similar rocks at Quito, South America. It is also common in the fissures of lava.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

Government Titles to Placer Claims.

Ever since the passage of Mr. Stewart's bill, providing a way for securing Government titles to quartz mines, a want has been felt for some similar law for the securing of titles to placer claims. A bill to accomplish this has been introduced into the lower house by Mr. Johnson, of this State, in which provision is made for the purchase, at a nominal price, of claims to which there is no adverse title, in exact accordance with the rules and regulations of the mining districts in which they are situated; that is to say, the owner of a cement, hydraulic, or any gravel claim, may obtain title to just so much land as the mining laws of his district concede to him, and no more. The effect of such a privilege would not give him an actual title to his claim, but would only secure it against jumpers and interlopers, and give it a more definite negotiable value. With proper restrictions, such a bill would be of great benefit. It should fix some limit for the size of single placer claims hereafter located, taking perhaps the medium allowance under local regulations.

Some law of this kind, fully protecting all existing rights, and carefully guarding against any attempts at monopoly, would meet, we think, with almost universal favor among miners. Of course, care should be taken to require a certain amount of work to be done annually; and any possibility of an undue accumulation of ground in the hands of any one company, to be held in perpetuity, without working, should be carefully guarded against.

The opposition which existed a few years ago against any plan for giving titles to mines, appears to have been pretty generally abandoned; and the opinion is now quite general that with the security which good titles would give to mines, there would be a large increase of investment in such property, and a proportionally improved development or that portion of our natural resources.

The law for acquiring titles to quartz mines has been almost universally acquiesced in, even by those who do not care to avail themselves of its privileges. The fact that such a privilege has been within the reach of all, for two or three years, and that no evil effects have been discovered from its existence, furnishes a very good argument for the creation of a similar law with regard to placer mines. There is no doubt that most of the placer mining districts, now languishing for want of capital for their development, would be advanced to prosperity by the enactment of a law which would render capital so invested safe from molestation under the security of a United States guaranty—even though it be not a title in fee. If such a law should be passed, miners would find their complications with railroad grants greatly simplified and improved; as under it they would have a direct way to obtain a title, without being obliged to travel through the circumlocution office of a privileged corporation. Should any of our miners differ from the opinion herein expressed, we should be pleased to hear from them—otherwise we trust it will be taken for granted by our delegation in Congress, that the miners of the Pacific coast desire the passage of a law giving titles to placer, as well as to quartz mines.

DR. NEWCOMB'S SHELLS.—It is probably known to our readers that Dr. Newcomb, of Oakland, has a cabinet of shells, which is said to have but two equals in the United States. It is reported that the Cornell University of New York have made a proposition for its purchase. We hope it will not be allowed to go out of our own State. The University of California ought certainly to have it; and we hope that Dr. N's answer may be delayed until the Board of Regents can consider the propriety of making a proposition for it in behalf of that institution.

"Material Wealth of California."

The above is the title of a valuable work which has already been announced, and which is now in the hands of the binder. We have been favored with the examination of some of the advanced sheets, from which we are also permitted to make the subjoined extracts. The work is designed to present the most recent, comprehensive, and elaborate treatise upon the history, geography, geology, natural history, population, industry and resources of the State which has yet appeared. Unusual pains have been taken to render the work a standard authority on all the subjects which it embraces. In pursuance of this end, the author has drawn upon every reliable source of information, and has employed the best ability in the State to assist him in original researches.

The work embraces a great variety of subjects, among which we may mention the following: To history the author devotes 70 pages; geography, 20 pages; statistics of counties, 237; climate, 21; agriculture, 43; geology, 37; zoölogy, 67; flora, 27; mining and metallurgical processes, 34; mines and mining, 34; manufactures, 47; San Francisco, 23. A large amount of space is also devoted to various miscellaneous topics, such as immigration, population, educational matters, railroads, petroleum, ship-building, etc., etc. The book will contain 700 large, imperial octavo pages, beautifully printed on heavy, white paper, in the highest style of the art, and will be accompanied with a valuable colored map of California and Nevada. The author makes especial acknowledgment to Dr. J. G. Cooper, Dr. Henry Gibbons, and Mr. J. S. Silver, respectively, for valuable assistance in the departments of zoölogy, climatology and agriculture. Especial mention is also made of Professor Silliman, Dr. Louis Landsweert, Messrs. Henry De Groot, Monroe Thompson, T. A. Blake, W. A. Goodyear, F. Bret Harte, and Wm. H. Knight, as having furnished important aid in the preparation of material for the volume. We make the following extracts from the sheets before us:

CHANCES STILL GOOD—IMPROVED CONDITIONS.

If, however, we compare the past with the present, and carefully canvass the advantages and disadvantages incident to both, it will be found that the chances for success do not preponderate so greatly in favor of the former as this class of persons are apt to suppose. In the first place, the cost of living, as above stated, was then enormous; the price of every article, whether of luxury or necessity, being out of all proportion to those now prevailing. Owing to a lack of wholesome food, medical attendance, comfortable dwellings, and other causes incident to the times, the miner was exposed to a variety of diseases, such as scurvy, chronic diarrhoea, rheumatism, etc.—none of which are now prevalent, some of them being almost wholly unknown. Formerly, much time was lost to this class in consequence of sickness—deaths, also, being proportionately more numerous than at present. Then, also, the lives of citizens were exposed to constant danger from acts of violence, the whole country being filled with vicious and reckless men, against whose attacks none were secure in either their persons or property, etc., etc.

Taught by the mistakes of his predecessors, the modern prospector, avoiding these errors, is enabled to insure for his expenditure of labor and means, if not always more remunerative, at least more certain returns; while, as regards comfort and health, the mining community of California enjoy these blessings in as full measure as almost any other, whether we seek for them in this country or elsewhere.

ADVICE TO EMIGRANTS.

If, then, the adventurer, having discarded all speculative aims, desires to pursue the occupation of placer mining, he will do best to seek the more northerly group of counties, comprising Placer, Nevada, Yuba, Butte, Sierra, and Plumas. If a novice, and without means, it will generally be found expedient for him to work on wages, until such time as he has become familiar with the modes of operating, and acquired some knowledge as to the character of the different kinds of deposits, their methods of occurrence, and the rules to be observed in prospecting for or searching after them.

With this knowledge and experience gained, he may proceed to take up claims for himself, if, as is generally the case, any of sufficient value can be found to justify locating; or, having earned some money, he may now buy an interest in grounds previously secured by other parties, and which, if not already developed to a productive condition, may have been sufficiently prospected to enable him to form a tolerably accurate estimate of its value.

* * * Auriferous deposits that a few years ago were overlooked as worthless, now give remunerative employment to large numbers of laborers. Quartz that could not, at one time, be made to defray cost of extraction, is now making millionaires of the fortunate owners; while tailings that were suffered to run to waste, having given rise to a new branch of mining, as we have seen, now being washed with largely accruing profits.

And thus, in canvassing the future prospects of the gold mining interest of this State, we are warranted in presuming that it will continue to experience large and constant expansion through the application of the same means that have hitherto worked these results; while the business of exploring for new mines, both in quartz, the ancient river channels, and in hydraulic deposits, will, no doubt, lead to important discoveries in every direction—the field of labor, from whatever point viewed, appearing almost illimitable, and the future full of encouragement and promise.

An important collection of facts is given, consisting of statistics, etc., comprising some twelve or fifteen pages, which go to show the present profitable and flourishing condition of mining, such as must present numerous

OPENINGS FOR ENTERPRISE, LABOR AND CAPITAL.

From the foregoing facts and well verified statements, the following conclusions seem fairly deducible: that the chances for making money in the mines of California are, to the industrious, frugal, and patient, nearly as good now, everything considered, as they were fifteen or sixteen years ago; that the inducements for immigration, more especially for mechanics, common laborers, and others desirous of hiring out their services, are great—the scale of wages ranging from sixty to ninety per cent. higher than in the Eastern States, and more than a hundred per cent. higher than in the best-paid labor markets of Europe—and, finally, that the opportunities presented for the safe and profitable investment of capital are vastly better in the mining regions of this State than can be found in any other country in the world.

We shall give further extracts next week. The work has been prepared by T. F. Cronise, Esq., whose long connection with the commercial and stock journals of this city, and intimate acquaintance with the general resources of the State, has eminently qualified him for such an undertaking. It will be published by the well known and enterprising house of H. H. Bancroft & Co., who will spare no pains or expense in putting it properly before the public. The work has been stereotyped by Faulkner & Son.

THE WHEEL QUESTION.—This still occupies the columns of the *Scientific American*. That journal continues to publish very excellent demonstrations that it is wrong in the position which it has taken. After every three or four such demonstrations, it serenely reiterates the simple remark: "We adhere to one." No demonstration of its own view of the question has been attempted, unless in a single instance,—in which, making use of the diagram of a "two-revolutionist," it handles the question in a manner which must be anything but satisfactory to its disciples. The latter, by the way, as a rule, show by their style that they have not been accustomed to such discussions. All plainly confound "axis" with "axle;" having, for want of familiarity with geometrical language, no conception of it as an imaginary line,—without other magnitude than length. A few others who perceive this, attempt to show that both sides are right. These are almost as wrong as the others; for a geometrical question must be stated in language that admits of but one interpretation,—and if we can understand this one, it is so stated;—so far at least, as regards the case in which both wheels are in the same plane. And this is plainly the case under consideration by the journal aforesaid.

[Editorial Correspondence.]

Work at the Hoosac Tunnel.

WESTFIELD, MASS., Feb. 12, 1868.

Note.—It is intended to state facts as briefly as possible in this article, mainly from notes and observations made Nov. 18th and 19th, 1867. The object is to afford a more direct railroad thoroughfare, with light grade, from Boston to Troy.

[Continued from Page 229.]

THE CENTRAL SHAFT

is 12,837 feet west of the east entrance of the tunnel. Our visit to the place occurred several weeks after the sad disaster which sacrificed the lives of thirteen workmen. Their bodies have not been recovered, and are supposed to rest at the bottom under 300 feet of water. It was a desolate sight to witness the ruins of the fire, the huge hoisting machinery bent, broken, and half enveloped in snow on the bleak and dreary mountain. For twenty feet down the shaft is of circular masonry work, about thirty feet in diameter. Below this, a platform, covered with snow, shuts out all vision, save through a small opening through which a gallant workman had thrice been voluntarily lowered in the vain hope of recovering the bodies of the unfortunate men.

The size of this shaft is mainly 18x27 feet—1,025 feet to the grade; present depth 600 feet, through solid rock. Stagings are built at short intervals. The workmen had no means of reaching the first staging from the bottom of the shaft at the time the works were consumed over the entrance.

One of the agents, who went in company with another man to the gasometer to turn off the over-supply of gas, informed us that a stream of ignited naphtha immediately followed the opening of a certain door, and it was only by good fortune they escaped serious harm. He states his undoubted conviction that the explosion occurred through some unknown agency, resulting from the nonuse of the gas generating apparatus. He insists that their lantern was left at a safe distance.

The work of repairing the damages was commenced by the State in November, the contractors throwing up their undertaking. Nearly five months have elapsed since the catastrophe, and still the bodies are not recovered. We are sure that in case of a similar accident in California, public sympathy and private enterprise would soon have devised means for restoring the remains of the victims to their afflicted friends.

The steam pumping and hoisting apparatus here must have been on a grand scale;—nearly all was ruined. On reaching the grade in this shaft, headings will be run both east and west;—rock of about the same character as in the east end tunnel.

THE WEST TUNNEL

is 9,747 feet west from the central shaft, and 2,447 feet east from the west end. Between the central and west shafts, towers the highest summit of the mountain—2,504 feet above the sea level, and 1,710 feet above the tunnel. Depth of western shaft, 318 feet; size, 8x14 feet. Double safety-cages are used; power supplied by steam engines; McKenzie blower used for ventilation; a compressing cylinder is prepared for use. Two headings have been worked over 6,000 feet each way from the bottom of this shaft. This portion of the work is very wet,—over 360,000 gallons of water being discharged daily. It is in contemplation to introduce the air drills here, which will greatly facilitate and cheapen the work. A small machine shop is in operation, running a planing machine and several lathes.

The rock encountered at this shaft is similar to that found in other portions of the tunnel,—tough slate, occasionally streaked with quartz. We were shown samples at the office bearing a strong resemblance to some of our gold-bearing quartz, containing sulphurets of iron, copper, and other base metals. No considerable lode of such ore, however, has yet been discovered.

Quite a village surrounds this shaft. The dwellings are new, cheaply built, and unpainted,—like many California towns of mushroom growth.

Across the ravine, a short distance, Prof. George M. Mowbray has established a manufacturing laboratory, at an expense of \$5,000, for the production of an improved article of nitro-glycerine. We are told the State Commissioners have promised to try his fluid, and use it only on condition it proves satisfactory. Experiments are now in progress and we are promised a report of their result. We venture the opinion that machine drills and nitro-glycerine will soon be used in all the headings, and the central shaft, and that the annual progress will yet be doubled.

AT THE WEST END

we find slow progress,—only 575 feet completed, against 4,800 feet at the east end. Cause, quicksands and land-slides. Several years since, the surface of the hillside made a huge stride towards the valley, caving in the tunnel. A fresh start with the work was necessary. An oval arch,—horse-shoe shape,—twenty feet in diameter, walled entirely around with three feet of masonry, is the style of its construction. Each lineal foot takes 6,000 brick. A large amount of expensive timbering is requisite to enable the building of the arch. Small tunnels and drifts are advanced to drain the dampness from the soil as far as practicable. The work is done by contract, at an expense to the State of \$500 per foot.

PRICES OF LABOR, MATERIAL, ETC.

Mineis, working eight and eleven hours, receive \$2.25 per day; laborers, ten hours, \$1.75; machinists, \$3; board, \$4.50 per week; steel for drills, 22 cents per pound; powder, 24-lb kegs, \$4; fuse, per 1,000 feet, \$12; exploders, with 4-foot wires, 10 cents each; wood, per cord, \$5. These prices are of course paid in currency. Since the first of January a moderate deduction has been made on the above rates for labor. Although the State, in loaning its credit, unwittingly

PURCHASED THE ELEPHANT, it must be admitted that it is turning it to good account, and as a work the Hoosac Tunnel is assuming a character worthy of the pride of Massachusetts. She is prosecuting the grandest mining enterprise on this continent. Day and night, from year to year, we trust her forces will continue to work,—resting on the Sabbath, only,—until the undertaking is finished. She has claims upon the whole Union for admiration for her zeal and philanthropy. Her patronage has developed the best pneumatic drill in the world,—an instrument which, if successfully introduced into the large mining operations of the Pacific Coast alone, would add millions of wealth to those States and Territories, and the nation.

Massachusetts has freely sent her consulting engineers to visit the Mt. Ceniz, and other prominent works in Europe, where they were welcomed and afforded every opportunity for observing the most skillful work of foreign artisans. Their reports have been published and furnished free to American mechanics, who quickly added improvement upon improvement.

The great tunnel of the Alps has proceeded, under the national patronage of both Italy and France, 25,000 feet, with 15,000 yet to finish. Massachusetts more recently entered the field, and single-handed has cut through harder rock nearly 7,500 feet, and has something over 17,500 feet yet to run. In Mt. Ceniz nearly 4,000 feet advance was made in nine months,—working Sundays,—during the past year; which advancement was greatly in excess of all former work. By additional headings worked from the central shaft, the use of nitro-glycerine, and the constant improvement of workmen and tools, Massachusetts may yet be found, all things considered, outstriking the work of longer experienced Europeans.

It is supposed the entire expense of the Hoosac Tunnel may reach \$10,000,000, or more, for which outlay the State will be recompensed by cheaper freight from the West, increased thrift of a portion of her citizens, and additional taxable property.

A. T. D.

LIND'S IMPROVED JOURNAL TURBINE.—Mr. Lind, of this city, has recently made an important improvement to his Journal turbine water wheel, for which he has taken steps to secure a patent. We shall illustrate and fully describe this improvement in a week or two. In the meantime we would state that Mr. Lind is meeting with good success in introducing his wheel. Several of them are already running in the State of Nevada, and a number in Mexico. Mr. L. is now in Santa Cruz, putting in his third wheel at the California Powder Works, where, as well as at other places, we understand it is giving good satisfaction.

LUCKY MAN.—John Tobin, one of the largest operating brokers in Wall street, and now worth \$2,000,000, three years ago was a gate-keeper at one of the New York ferries.

OF NEW YORK.

Assets, - - over \$3,000,000.

Number of Policies issued in 1867, 10,300.

Amount Insured, - - \$31,375,671 00.

POLICIES ISSUED AT ONCE,

On receipt of Application at the San Francisco Branch Office, without referring to the Home Office at New York.

Policies Paid in Gold Coin or Greenbacks,
at the option of the person insuring.

[Extract from report of the Home Office, for Dec. 1867.]
"The Company's history for the past fifteen years shows favorably, and it stands to-day ranks among first class Societies. It has carried out in good faith every contract made by it, never contesting a Southern claim during the war, while it is well known that many of our largest companies repudiated their Southern risks at the commencement of our National struggle, thereby increasing their assets. This honorable dealing of the Knickerbocker in the past, is a pledge of its future good faith."

Notice.

MR. RUSSELL, WHO CALLED ON US IN MAY, 1867, in reference to an analysis, will hear something to his advantage, by addressing FALKENAU & HANKS, 12v16 619 Montgomery st., P. O. Box 1181, San Francisco

To the Mining Public.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST twenty years as Superintendent for various Companies, working mines of Gold, Copper, and Argentiferous Galena, offers his services to examine and report upon mines and mineral property. Reports accompanied by Plans, Sections and other Drawings. Also would be willing to take the management of any legitimate mining enterprise. If necessary, satisfactory reference given. Address, 14v16f H. H. SHELTON, Copperopolis, Cal.

UNDERGROUND TELEGRAPHY.—The Savage Mining Company, of Nevada, are preparing to put up wires to connect the bottom of their main shaft with the surface. The bell-rope, in present use, is constantly getting out of repair in consequence of the strain required upon it for signalling. Every break involves a large loss of time, as it is not safe to work without signals. The *Territorial Enterprise* in describing it says: The line will be worked with the same kind of a battery as is used on other telegraph lines, and will be used for striking the signals on the bell at the top of the shaft. At every station there will be placed an apparatus for telegraphing, and so simple is the operation that any miner can learn to use it in half an hour. There is nothing but a small box in which is a ring suspended from a wire, and in order to signal those above the miner has only to put his finger into the ring and pull down upon it as often as he wishes to cause the bell to strike. The apparatus is the invention of Frank Thayer, head engineer of the works, and will soon save to the company five times its cost.

GOLD IN NOVA SCOTIA.—"A. H." Halifax, N. S., writes thus to the *London Mining Journal*, Jan. 30th: "Sir—A gold yield has just occurred here, which in any other country would produce quite an excitement: 13 tons of quartz crushed at Uniacke district yielded 231 ozs. of smelted gold, or nearly 18 ozs. on an average per ton. Another lot of 43 tons from the same shaft, crushed a fortnight ago, gave 96 ozs. Sherbrooke, too, sent up early in the month a brick weighing 612 ozs., the product of one month's work on the Wellington property. The other districts just hold their own, on account of the season being unfavorable for surface labor; but great progress has been and is still making at Laurence Town, of which a detailed report by next steamer."

Smelter Wanted.

A WORKING MAN, CAPABLE OF TAKING CHARGE of one of the shifts in running a Blast Furnace, for reduction of Lead and Silver Ores. Address this office, 13v16-3m.

To Capitalists.

FOR SALE—THE CONTROLLING INTEREST IN ONE of the best Gold and Silver Mines in the State of Nevada. The owners not having sufficient means to purchase the necessary machinery to work to advantage, will dispose of a portion of the mine at a bargain. Any one willing and able to embark in the enterprise, will be shown and probably convinced that it is no visionary scheme. The ledge will now pay more than the expense of working it, and is very rich, increasing in width at every foot in depth. For particulars apply at this office. 13v16-1m.

Mining Secretary.

THE SUBSCRIBER, HAVING SERVED FOR THE LAST five years as Secretary of various mining companies, feels fully competent to serve in that capacity. Any parties wishing to secure the services of a Secretary can be accommodated on reasonable terms. Information given, and all necessary papers correctly made out. Having had a long experience in the purchasing of goods and machinery for miners, parties in the mines will find it to their advantage, where purchasing agents are employed, to send their orders to the undersigned.

Rates of Postage on Printed Matter to Europe and Asia.

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:

Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:

NEWSPAPERS—MARKED AS FOLLOWS:

Bremen, by Bremen mail—2 cents each.
Hamburg, by Hamburg mail—2 cents each.
Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.
Lunenbourg, by Bremen mail—3 cents each.
Lunenbourg, by Hamburg mail—3 cents each and 1 cent per 1½ ounce.

Schleswig Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1½ ounce.
Sweden, by Bremen or Hamburg—3 cents each, and 1½ cent per 1½ ounce.

Norway, by Bremen or Hamburg—3 cents each, and 3½ cents per 1½ ounce.
Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.

Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.
Switzerland, by Bremen or Hamburg—4 cents each.

Italy, by Bremen or Hamburg—5 cents each.
Turkey, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.

Greece, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.

Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 2½ cents per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1½ ounce.

Austria, India and China, by Bremen and Hamburg mails, via Trieste—3 cents each, and 2 cents per 1½ ounce.

PERIODICALS, ETC.

Bremen, by Bremen mail—1 cent per ounce.

Hamburg, by Hamburg mail—1 cent per ounce.

Prussia, Austria and German States, by Bremen or Hamburg—1½ cent per ounce.

Lunenbourg, by Bremen mail—1½ cent per ounce, and 1½ cent per 1½ ounce.

Lunenbourg, by Hamburg mail—1½ cent per ounce, and 1½ cent per 1½ ounce.

Schleswig Holstein and Denmark, by Bremen or Hamburg—1½ cent per ounce and 1½ cent per 1½ ounce.

Norway, by Bremen or Hamburg—1½ cent per ounce, and 4 cents per 1½ ounce.

Sweden, by Bremen or Hamburg—1½ cent per ounce, and 4 cents per 1½ ounce.

Holland, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.

Russia, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.

Switzerland, by Bremen or Hamburg—1½ cent per ounce, and 1 cent per 1½ ounce.

Italy, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.

Turkey, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.

Greece, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.

Gibraltar, Spain and Portugal, by Bremen or Hamburg—1½ cent per ounce, and 2½ cents per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mail by way of Marseilles—1½ cent per ounce, and 9 cents per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mail, by way of Trieste—3½ cents per ounce, and 2 cents per 1½ ounce.

These charges are in each case in full to destination, combining rates between the United States and Bremen or Hamburg, and the rate beyond Bremen and Hamburg to points of delivery.

MOSHEIMER'S

Pioneer Mining School.

Office, 348 Montgomery Street,

SAN FRANCISCO.

MOSHEIMER'S

NEW ROASTING FURNACE.

Patent applied for.

This Furnace has proven the most successful of any ever built on this Coast. A great number are in use now, and many in course of construction. Their superiority over all other furnaces, is as follows:

1.—The cost of building is only \$300 for a one ton Furnace.

2.—They require less than half a cord of wood per ton of ore.

3.—The ore is roasted to a spongy condition; while in a common Reverberatory it cakes into globules,

4.—It is a saving of 50 per cent. of labor over any Furnace in use.

A full size working Furnace can be seen at my Metallurgical Works in this city, by applying at my office.

JOS. MOSHEIMER,

323 Montgomery street, San Francisco.

A Sulphuret Mine Wanted.

JOS. MOSHEIMER,

San Francisco.

THE GOLDEN ERA.

Founded in 1832, It is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Francisco.

AN INSTRUCTIVE BOOK!

Prof. LAYNES'

ELEMENTS OF COMPOSITION.

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYNES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Scott.*

I am prepared to concur in the recommendation of the Honorable superintendent of Public Instruction.—*J. C. Felton.*

After an careful and thorough perusal of the same as it was in my power to give, I come to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. H. Hall.*

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—*F. W. Hall.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Dennis.*

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—*Charles L. Atwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, A. M.*

I believe the work will be a valuable and much needed addition to our school text books.—*Herman Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*I. H. Brayton.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and advocates at the bar.—*John Curry.*

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * * Exactly calculated to interest. * * * It will soon become a necessity in every lawyer's library.—*Charles A. Tullie.*

Its clearness and comprehensiveness make it easy.—*G. W. Bovee.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so much an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Laynes has done the cause of popular education good service.—*S. F. Bulletin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—*Atlas California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. F. Times.*

Prof. Laynes plunges at once "in medias res." He seizes a sentence (which is the unit in composition), whether written or spoken, holds it up before you; tears it to pieces before your eyes—or rather, he should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity, gradually teach you not to feel the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, elegance and oratory. A desideratum long felt is supplied.—*S. F. Examiner.*

This is an age in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stockton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Napa Valley Appeal.*

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.
Office, 318 California street, up stairs, San Francisco, California. mar21

San Francisco and Castle Dome Mining Company, Location of Works: Castle Dome County, Arizona Territory.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-sixth day of February, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
S R Stoddard	100	400	\$10 00
S R Stoddard	101	400	40 00
S R Stoddard	102	200	10 00
S R Stoddard	104	25	2 50
S R Stoddard	105	10	1 00
S R Stoddard	106	10	1 00
S R Stoddard	107	5	50
S R Stoddard	109	5	50
S R Stoddard	110	5	50
S R Stoddard	117	50	5 00
E W Casey	146	50	50 00
Henry Durant	182	100	10 00

And in accordance with law, and an order of the Board of Trustees, made on the twenty-sixth day of February, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by John Middleton & Son, at their salesroom, No. 310 Montgomery street, San Francisco, Cal., on Tuesday, the twenty-first day of April, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. R. SMITH, Secretary.
Office, Room No. 16 Stevenson's Block, Cor. Montgomery and California streets, San Francisco. ap4

Succor Gold and Silver Mining Company.—Location of Works: Storey County, State of Nevada.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the tenth day of February, 1868, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Aldrich, Lewis	113	79 1-24	\$39 40
Aldrich, Lewis	151	44-1/2	22 25
Aldrich, Lewis	155	151 13-24	75 77
Over, Benjamin	71	20	10 00
Over, Benjamin	72	5	2 50
Over, Benjamin	73	5	2 50

And in accordance with law, and an order of the Board of Trustees, made on the tenth day of February, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs Olney & Co., No. 418 Montgomery street, San Francisco, on the fourth day of April, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

E. J. MOORE, Secretary.
Office, Nos. 77 and 78 Montgomery Block, San Francisco, California.

POSTPONEMENT.—The above sale is hereby postponed until Saturday, the eleventh day of April, 1868, at the same hour and place. By order of the Board of Trustees.

E. J. MOORE, Secretary.
mar21

Illegal Supplemental Advertising.—It would be well for Mining Companies, whose advertisements are repeatedly appearing in the Supplements of daily papers, to inquire into the legality of that class of advertising.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the greatest number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply energy directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and sellers for themselves, at the
PACIFIC FOUNDRY,
1st
San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

NOTICE TO MERCHANTS

—AND—

MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common hoist—viz: Greater strength; less danger in working; no goods require no slitting or landing; consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any lashing or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pulley, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, complete, \$600

No. 2—Or 15-inch crusher, capable of similarly reducing through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

EXPLANATION OF THE ABOVE ENGRAVING.
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the motion is applied to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, O, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: **RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866.**
JAMES BRODIE, Esq., San Francisco—My Dear Sir: I give me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the improved German Barrel, for a longer term than twelve months. All persons desirous of procuring the same, without having recourse to legal proceedings, for past infringements or desirous of receiving Letters of License for the limited period named, are requested to address as below.

A diagram, with explanation of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations are afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866. **JAMES BRODIE, Fulton Foundry, or CHAS. B. BOLDCLIFF, Express Building, 402 Montgomery street, San Francisco.**

BLAKE'S PATENT
QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866

This Patent secures the exclusive right to employ in Stone-Breaking Machines Up-right Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

THE RICHEST IRONMASTER IN ENGLAND.

In our issue of Feb. 29th, we mentioned the death of Mr. Crawshaw, an ironmaster whose estate amounted to some thirty-five millions of dollars. The following is from the *Mining Journal* of Feb. 22d: "The almost fabulous wealth of the Crawshaw family has already been noticed in the *Journal*, and it may be interesting to many of its readers to learn how small beginnings may terminate. In the last century the original Crawshaw, then a farmer's son, rode to London on his pony (his sole property) to seek his fortune. He began by sweeping out the warehouse of an ironmonger, who was of a discriminating mind, and saw that young Crawshaw had good stuff in him. The ironmonger had been speculating in sending out iron pots to America, and his astute apprentice observed that, if the Americans used so many pots, they must want hooks to hang them on. Whereupon the master not only took the hint, but kindly determined that Crawshaw should send them out, and that he would lend him the money for the purpose. Upon this venture was realized 100%, and from that time the farmer's son moved rapidly upwards, being first taken into partnership by his master, and ultimately becoming an iron king in South Wales, whose descendant, lately deceased, has left, it is computed, above seven millions sterling. It is a curious fact that from this stock have arisen (in so short a time) two haronnetages and one peerage—that of Llanover."

Too Fast.—The *New York Times*, in advocating the passage of the bill before the United States Senate for the establishment of a Naval Board of Survey, gives as one instance of the necessity of such a board the following statement:

"There are in process of storing at the various navy yards no less than fourteen sets of engines which have been finished without any ships ever having been begun to put them in. It would be a monstrous folly even for an overburdened treasury to lay up in store such useless things as marine engines, without a single keel being laid for them, not only because the engine should be built for the ship instead of the ship for the engine, but also because the engines, with the progress of science, are in danger of going out of date. For our own country, which is selling all its spare material in order to keep down its debts, the thing is preposterous. These engines cost \$400,000 apiece, and here we have an item, for the fourteen, of \$5,600,000."

Piorwick.—An exchange asserts that the Minnesota Historical Society, in their late excursion to Lake Minnetonka, to investigate the remains of the "ancient mound builders"—a race dwelling in this country long before the arrival of the Indians—were successful in finding several human bones, which, after a labored discussion, proved to be the broken limbs of trees. A supposed skull elicited great attention from its remarkable phrenological development, but a rustic demonstrated to the learned gentlemen that the supposed cranium was in truth a mud-turtle's shell. Several mounds, it is stated, have been prepared and supplied with bones and pieces of broken crockery for the future investigation of this Society.

Jets of Naphtha.—An artesian well of naphtha has been discovered at Kudaco, in the Caucasus, by boring. At the depth of 274 feet from the surface the liquid was first struck, and for a whole month gave a supply of 1,500 barrels daily. Since then a fresh source has been met, which rises with irresistible force to the height of forty feet above the ground, the jet being four inches in diameter, and delivering a daily supply of 6,000 barrels.—*Builder.*

IMITATION OF OLD TAPESTRY.—A new kind of wall decorations is being manufactured in Paris. It consists in laying colors upon canvas sewed together in breadths. The cloth itself gives the lights. The colors are mixed with analbuminous composition, and are fast. The imitation of the old tapestry of the middle ages is very perfect; so expert have the artists become in laying the colors.

REFINING OF SUGAR.—A modification of the refining process has been patented in Europe, by L. Pierre and R. Massey. After being clarified in the usual way, with lime and carbonic acid, the juice is treated, at boiling temperature, with caustic baryta, (60 parts to every 100 of sugar,) the precipitate suspended in water and decomposed with carbonic acid. The pure solution of sugar thus obtained, is then evaporated.

COAL TAR FOR FENCE POSTS AND SHIPS' BOTTOMS.—Mr. O. F. Raymond, of Norwalk, says he has used hot coal tar with great success in preserving from decay fence posts and other timber exposed to alternate wet and dryness. He places the posts in the boiling tar for a few minutes, then sprinkles them with clean sand. After setting the posts, the portion above ground is paid over with hot tar and coated with sand.

He claims also to have a composition of which coal tar is the basis, designed to be used on the bottoms of vessels to prevent fouling and the ravages of the teredo. He claims that a vessel coated with it can make a voyage to the East Indies and back, without, on her return, having a single barnacle clinging to her bottom or a worm in her timbers, except such as may have been in before the composition was put on.

TO PRESERVE BOOKS FROM MOLD.—A correspondent of the London Builder says that books are effectually preserved from mildew by lightly washing the backs and covers with spirits of wine, using the feather of a goose-quill as a brush.

THE CELEBRATED
Self Generating Portable
Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivalled, burning with unimpaired brilliancy in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap, and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vice and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKER, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 18v11 3m-8

BRANCH
OF THE NEWARK, N. J.,
Metallurgical Works.

BALBACH & BROTHER,
No. 315 Howard Street, bet. Fremont and Beale, San Francisco.

Assays of Gold, Silver, Copper and Lead Ores.

Gold and Silver Ores and their Sulphurets, worked in any quantity, from a few pounds to any number of tons, it desired, by the Chlorine Process. Also, Jewelers' and Bankers' Sweepings.
Consignments of Gold and Silver Ores solicited.
Refining of Bullion at usual rates.
Agents for Ed. Balbach's Improved Process for Separating Silver and Gold from Lead. 25v15-3m

JOHN TAYLOR & CO.
IMPORTERS,
AND DEALERS IN

ASSAYERS' MATERIALS,
Druggists' & Chemists' Glassware,
Photographic Stock, Etc.

512 and 514 Washington Street,
SAN FRANCISCO.

WE are receiving direct from MESSRS. LADD & OERTLING (London) and BECKER & SONS (Antwerp, Belgium) their superior

ASSAY AND BULLION BALANCES,
And from France and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, NUFFLES, BLOW-PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have given this branch of our business particular attention, to select such articles as are necessary in the development of the mineral wealth of this coast. A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUPPLIES, ACIDS and CHEMICALS, constantly on hand.
San Francisco March 6, 1865. 11v10 1f

MANHATTAN
Metallurgical and Chemical Works,

Nos. 552 and 554 West Twenty-eighth st.,
NEW YORK.

Assays of Gold, Silver, Copper and Lead Ores.

SPECIAL ATTENTION GIVEN TO THE ANALYSIS OF
Ores, Minerals, Clays, Waters, and General Commercial Products of all kinds.

Tests of Gold, Silver, Copper and Lead Ores, by Smelting, in quantities of fifty pounds to five, ten or fifty tons. Consignments of ores solicited.
Refining of Bullion at usual rates.
Foundries and Metal Workers furnished with alloys of every description.

Plans and specifications furnished for works, and processes for the manufacture of Sulphuric Acid, Soda Ash, and general Chemical Products.
Superintendent, Mr. WILLIAM WEST, formerly of Swansea, Wales.

For engagements and terms, apply at the office of

THE PHILOSOPHY OF MARRIAGE, BEING FOUR IMPORTANT LECTURES ON FUNCTIONS AND DISORDERS OF THE NERVOUS SYSTEM AND REPRODUCTIVE ORGANS, to be had by addressing and inclosing twenty-five cents, postage stamps, to Secretary PACIFIC MUSEUM OF ANATOMY, Montgomery street, San Francisco. 2v13 1v

"The Excellent"
Will not repair broken limbs nor leaky roofs; but it will quiet the nervous and brace up the weak. It will give more comfort to those suffering from dyspepsia or indigestion than any preparation you ever tasted or heard of. The first physicians use it, and it is made by
HARRY A. PATTEN,
5v16 3m 413 Montgomery street, San Francisco.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

PACIFIC ELASTIC SPONGE CO.—April 23. Capital stock, \$50,000; 500 shares, \$100 each. Trustees: W. R. Strong, Henry H. Linnell and John M. Avery.

OROVILLE WATER CO.—April 23. Capital stock, \$15,000; 1,500 shares, \$10 each. Trustees: Silas W. W. Coughy, J. M. Clark and Daniel Hilton.

HARRISON STREET HOMESTEAD ASSOCIATION.—April 8th. Capital stock, \$52,000; 80 shares, \$650 each. Trustees: Henry Mahan, G. Railsback, Jno. M. Milliken, Henry Chester, Philip H. Blake, A. L. Chamberlain and J. W. Nye.

PAUL TRACT HOMESTEAD ASSOCIATION.—April 8th. Capital stock, \$255,000; 520 shares, \$500 each. Trustees: Henry F. Williams, S. Heydenfeldt, Henry A. Crane, Louis Slose, W. C. Ralston, A. T. Fletcher and T. B. Wilde.

ELECTION OF OFFICERS.—**JOURNEYMEN LATHES OPERATIVE UNION.**—April 7th. President, Thos. J. Shields; Vice President, Wm. O. Southwick; Secretary, John G. Gillway; Treasurer, John C. Buckmaster; Sergeant-at-Arms, John McGovern; Investigating Committee, Thomas McGee, Thos. Conners, James Donnelly.

PROFESSIONAL NOTICE.—By reference to our advertising columns it will be seen that Mr. G. W. Maynard, having accepted the Professorship of Metallurgy in the Polytechnic Institute, Troy, N. Y., has retired from the firm of Maynard & Tiemann. Mr. J. H. Tiemann remains at 240 Pearl street, where those who desire a competent mining engineer and metallurgist, can secure his services.

DISEASES OF THE EYE.—During a late visit to San Francisco, we fell in with an old acquaintance from this country, Mr. G. W. Purdy, who formerly resided at Fort City. About two years ago, while under treatment, we saw Mr. Purdy at the office of an oculist in that city, with eyes badly inflamed and the sight entirely lost. We saw him a few months later at another physician's, but his case was scarcely improved, and seemingly hopeless. His eyes have now entirely recovered, so that he goes about his ordinary business. From his own lips we learned that the restoration of his sight was entirely due to Dr. D. R. Morgan, whose office is at No. 637 Sacramento street, between Montgomery and Kearny, who cured him in the short space of eighteen weeks. Mr. Purdy mentioned several remarkable cures which occurred in the practice of Dr. Morgan during the time he was under treatment, among which was that of Mrs. Jane Albert, of Brownsville, Yuba County, and several others. Mrs. Albert had been afflicted with sore eyes from early childhood, and for eleven months previous to treatment she had not been able to discern light, nor had she seen the features of her youngest child, twelve months old. She had heard of the remarkable cure of Leonard P. Eder, of Marysville, and Joseph E. Haskell, of Sacramento, and determined to try Dr. Morgan. The result was that she was able, after ten days, to read ordinary newspaper print. Mr. Purdy was of course greatly rejoiced at the recovery of his sight, after so many trials and failures with different physicians.

The above is clipped from the *Mountain Messenger*, of February, 1896. 18v163m

MEDICAL AUTHORITIES have announced that not less than one-third of the entire population of the United States are afflicted with Neuralgia in some form. Surely the man who can safely remove such a vast aggregate of pain is a great public benefactor. Such is Dr. Turner, of Boston, in Massachusetts. His "Universal Neuralgia Pill" is pronounced on all hands to be an entirely harmless and perfectly certain remedy for this most torturing of all known diseases. See advertisement in another column.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions twenty per cent. cheaper than ever before, and the very best articles in market. The store is located at 115 Sutter street, Lick House Block. 23v15cf

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. **DRS. BEERS & JESSUP**, corner of Montgomery and Sutter streets, over Tucker's Jewelry Store, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with *rust gold*—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 18v14cf

Miners, Vis 718 to mining districts, R. B. EMPLOYERS, and TRAVELERS generally, should insure against all accidents in the *Traveler's Life and Accident Insurance Company* of Hartford before leaving the city.

WM. MACDONALD & CO., Gen'l Agents.
7v163p 121 Montgomery St. opp. Occidental Hotel.

Accidents.

The Traveler's Insurance Company, of Hartford, Ct., insures against death or disabling injury by accident. \$100,000 per week paid the insured in case of injury preventing the prosecution of his business; \$50,000 paid to his family, or legal representative, in case of his death by accident. No medical examination required. **WM. MACDONALD & CO., Gen'l Agents.**
7v163m 121 Montgomery St. San Francisco, Opposite Occidental Hotel.

BAKER & HAMILTON,

IMPORTERS AND DEALERS IN

Agricultural Implements, Portable Steam Engines, Hardware,

RUBBER BELTING, Etc., Etc.,

Nos. 17 and 19 Front street, San Francisco, and 9, 11, 13 and 15 J street, Sacramento.

Wood & Mann's Portable Steam Engines, 6, 8, 10, 12 and 15 horse power,

With newly invented Water Bottom, which entirely surrounds the fire grate and ash-pit, forming underneath the ash-pit, and the sides of the furnace, a three or four inch water space, by which additional heating surface is obtained, the accumulation of sediment around the fire-box or furnace is entirely prevented, and renders it perfectly safe to use near any barn, or in any farm-yard, or in any building where a stove would be a lowered, as no marks can possibly escape from the furnace or ash-pit. The sediment has a free passage to the bottom of the fire-box, and can be blown off daily by the blow-off cock underneath the ash-pit, by which means the boilers may be kept clean much longer than under the old system. The great saving in repairs which is effected by the use of these water bottoms, and the constantly increasing demand for them, prove their superiority to any others yet constructed.

HOADLEY'S THRESHING ENGINES,

HITTINGER & RAWSON'S IMPROVED HOISTING ENGINES, 6, 8, 12 & 20-horse power.

For Sale by

BAKER & HAMILTON.

Front street, bet. Pine and Market, San Francisco.

J. STREET, NEAR THE LIVERY, SACRAMENTO.

18v163t

PAINE & STEPHENS' IMPROVED CONCENTRATOR,

For Saving Gold and Silver Sulphurets.

This invention, a perspective view of which is given above, consists in applying machinery to the ordinary huddle, and rendering the same automatic in action. It is calculated to do a large amount of work.

One Machine, costing about \$1,400, is sufficient to work the Sands from 25 to 30 Stamps. But very little power is required.

It can be easily run by one man turning a crank. The principle on which it works is entirely dissimilar from any other machine now used on the Pacific Coast; although it is in almost universal use in Europe; but not so arranged there as to be automatic in action.

The illustration given herewith, was fully described in the *Mining and Scientific Press* of March 21, 1896.

One of these machines may be seen in constant operation at the Eureka (Watt's) mine in Grass Valley, where it is giving the fullest satisfaction, and is working all the tailings from thirty stamps. Another machine may be seen at the Banner mill, in Nevada, and a third below the Gould & Curry Company's mill, near Virginia City.

For further information, apply to **THOMAS N. PAINE**, Grass Valley, California.

PAINE & STEPHENS.

18v163w

W. T. GARRATT, City BRASS AND BELL FOUNDER.

Cor. Mission and Fremont Sts., SAN FRANCISCO.

Manufacturer of **BRASS, Zinc, and Anti-Friction or Babbitt Metal Castings:** CHURCH AND STEAMBOAT BELLS.

TANKS AND HAND BELLS AND GONGS.

FIRE ENGINES, FORCE AND LIFT PUMPS,

Steam, Locomotive, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Also and all other Joints, Spellers, Solder, and Copper Pipes, etc. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles, etc.

HYDRAULIC PIPES AND NOZZLES

For Mining purposes, Iron Steam Pipe furnished with Fit tines, etc. Coupling Joints of all sizes. Particular attention paid to Disulphur Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

Best Market price paid for OLD BELLS, COPPER AND BRASS. 6v

JOHN G. HODGE & CO., Importers and Wholesale Dealers in **STATIONERY, Blank Books, School Books, PLAYING CARDS, Wrapping Paper, Paper Bags, etc., etc.**

Nos. 329 and 331 Sansome street, corner Sacramento. Special attention given to orders from Country Merchants. 23v163w 19p

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1890, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY, and 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 18v163p

Postage.—The postage on the *MINING AND SCIENTIFIC PRESS* to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked with Bremen and Hamburg line) three cents per copy, prepaid. Single copies to any address in the United States, two cents.

Mining and Press. Single Copies, Fifteen Cents.

Terms: One Year, \$5; Six Months, \$3.

Tustin's Improved Adjustable Windmill.
 In a country such as ours, where high winds prevail, particularly in the dry season, and where fuel is scarce and expensive, the force of the wind as a motive power will doubtless continue to be utilized more and more from year to year. Our arid plains need it for irrigation; it will be called into

sary. These considerations, were there no others, are sufficient to render every improvement in this direction a matter of general public interest.
 The accompanying illustration is intended to represent a recent invention of Mr. W. I. Tustin,—a practical mechanic of this city, and by no means a novice in this branch of industry, as he is well known as the inventor of a self-regulating windmill

cap being sufficiently wide for the box to turn readily within it, to suit any direction of the wind. Upon the head of this upright column, within which the pump-rod works, is fitted and bolted a strong iron box, having a rotating circular top upon which the crank-shaft of the wind-wheel rests. The guide vane, which is connected with the iron cap of the column by means of a socket, subserves the purpose of keeping the wind-wheel in a proper position with reference to the direction of the wind, and for properly regulating its velocity.

A, is an endless rope, supplied at its lower extremity with a sheave, and also a weight to keep the rope in its proper place. B represents a sheave over which the rope runs; and C a pulley around which it also passes,—this pulley, and the circular cap at the upper extremity of the box, being connected by the iron rod in its rear, as seen in the engraving.

By drawing down on the rope (A) the wind-wheel will be turned, facing the wind more or less as may be required. To stop the mill, or reduce its power, it is only necessary to draw down upon the opposite rope, and by this simple means the power or velocity may be graduated as desired, according to circumstances, without ascending the mill.

This machine is represented as so simple in construction, and in all appliances for operating it, that a child may start or stop it at pleasure, or set it to receive any given amount of power that may be required, being controlled far more easily than any other windmill in use. The almost unanimous verdict in regard to it, as rendered by many of the most competent mechanics and farmers of the State, who have thoroughly examined it, as set forth in the inventor's circular, represents it as the strongest, most durable, and the simplest in construction, as well as the most efficient in working, of anything of the kind hitherto introduced. The public, however, have now an opportunity of examining these mills, and judging for themselves as to their merits, as one of them may be seen daily at the junction of Turk and Mason streets with Market.

They are now being manufactured at the carriage and railroad car factory of H. Casebolt & Co., corner of Fifth and Market streets, in this city, and are now for the first time brought to the notice of the readers of the Press.

The inventor has taken the necessary steps, by filing a caveat for further perfecting his machine, and securing his rights, as preliminary to making application for letters patent.

BUSY AND LUCKY.—The London Underground Railway has, during the five years of its existence, carried 80,000,000 passengers, at an average speed of sixteen miles an hour, and without the loss of a single life. Twenty-one millions of passengers were carried in 1866, and 23,000,000 in 1867. About 3,000 trains run over it per week, running the greater part of the day every five minutes.

THE "POPULAR DICTIONARY."—While in Springfield, Mass., recently, we had occasion to call upon Messrs. G. & C. Merriam, publishers and owners of the copyright of Webster's Dictionary. We knew they were as popular, as individuals, in their local community, as their dictionary is throughout America. Before we left their office we better understood the reason of this popularity. They are affable, unassuming, straightforward, and liberal men. Bestowing close and studious attention to business, they have been preparing for the recent edition ever since they came in possession of the copyright, in 1847. Although too much credit cannot be given the talented men who assisted in the literary work, it is evident that only by the fortunate combination of prudent foresight, incessant care, impartial and liberal direction of the "head center," could such a work as the present "Webster" be builded up.

We were shown by Mr. Merriam an immense pile of revised copy, an examination of which shows the great number of changes and additions made to each page of the work. A life-long use of the book could not more plainly reveal the magnitude of the undertaking. It stands preëminently alone in the literary field, with a likelihood to long continue so, for probably no other publishers would have been willing to venture upon such an expensive enterprise; nor would the Messrs. Merriam have felt justified in carrying the work so far in advance, but for the extensive patronage achieved by former editions. Persons who own the former edition, should not consider it in comparison with the "unabridged" of 1865.

FIRST SIGHT OF A LOCOMOTIVE.—A number of Chinese notables who are connected with the Embassy now in this city en route for the Atlantic, made an excursion the other day on the Alameda Railroad. The affair was entirely new to them, and they examined everything with curious interest, making appreciative and intelligent inquiries. They take especial note of all machinery, as if conscious that the secret of the wonderful progress of the "outside barbarians" was to be sought for in the mechanical arts.

BORAX FOR PRESERVING WOOD.—Sigismund Beer, of New York, has taken out a patent for preserving wood by treating it with a boiling solution of borax in water.

requisition to supply water for our newly settled farms; for our herds of cattle and other live stock, as they are driven back from the great centers of commerce and agriculture by a crowded immigration; for the numberless locomotives of the various railroads about springing into existence,—and for a thousand other purposes to which this power may be applicable. Where it can be used to advantage, it is the most economical power known.

The original outlay for a first class windmill, is less than for any other power of equal capacity. When once erected, there is, comparatively, no expense required to keep it in operation, day and night, if neces-

sary. These considerations, were there no others, are sufficient to render every improvement in this direction a matter of general public interest.

The frame of the adjustable mill is composed,—as will appear by reference to the engraving,—First, of four uprights, terminating at their upper end in a cap, to which they are firmly bolted. Second, of two cross-beams, locked and bolted together at the center, and fastened also at their ends to the uprights by means of bolts. An upright cubical box, furnished at its lower extremity with a hollow pivot gudgeon, fitting into a step, bolted to the cross beams of the framework,—through all of which the pump-rod is made to work,—passes through the cap at the upper part of the frame, the

TUSTIN'S IMPROVED ADJUSTABLE WINDMILL.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

Engineers;—Who and What They Are, and their Duties to their Employers and the Public.

EDITORS PRESS:—It seems strange to me that there should be thought anything of importance in the above heading; yet, to the careful readers of our daily papers, who so frequently see the record of fearful boiler explosions, with great destruction of life and property, it may suggest a momentary thought. The careful engineer, who has served an apprenticeship in the manufacture of engines or boilers, on reading an account of a fearful explosion, invariably exclaims,—"Another practical lesson to the world, confirming the fact that cheap and inferior engineers are disastrous to life and fire insurance companies!"

The careful engineer feels as safe in the discharge of his duties, as the farmer does in his barn, shelling corn. It makes no difference to him whether he is on a locomotive in a dark, stormy night, on the boisterous sea, or in the noisy quartz mill,—it is all the same to him. He has his hammer and wrench, his chisel and caulking tools, plugs, canvas, lead, oil and tallow, where he can lay his hand on them at once; and he knows how to use them. He is not surprised by the bursting of his steam-pipe or cylinder-head. He does not go to the owner, superintendent or captain, with tears in his eyes, because his pump refuses to feed water into his boilers; neither does he attempt to feed when none is indicated by his gauge.

The writer was a fireman on a propeller on Puget Sound, in 1859, when the engineer attempted to force him into the furnace because he refused to add more fuel to a heavy fire, when no water was to be found, and while the crown sheet was at a red heat; he remembers he fought for dear life. It is no uncommon occurrence for many so-called engineers to put on their pump, with a heavy fire, and no water to be found. I have frequently seen it done. The writer was once a passenger on the steamer St. Louis from New York to Aspinwall. When a few days at sea, one of the boilers commenced leaking, and the chief engineer was obliged to secure the services of the mechanical force among the passengers, to patch and caulk the leaks.

During the early days of the late rebellion, the writer was acting as a petty officer in the engineer's department of one of the floating palaces between San Francisco and Panama. On one of the trips, as inferior a workman as he is, he was the only mechanic in the department, except the chief engineer. An engineer, Mr. W., recently told me of an incident that once occurred to him. He was employed in Sacramento to go to the mountains and take charge of a quartz mill. He found a man there who was acting as engineer. Mr. W. asked him how long he had been there; he said three years. In the course of other necessary investigations and repairs, Mr. W. proposed to remove the cylinder-head, and examine and set out the springs against the rings, if necessary. Mr. Smarty, the engineer of three years' experience, remonstrated and said that it was entirely unnecessary, as he had not had the cylinder-head off since he had been there, and the engine ran well as it was! Mr. W. being the engineer in chief, would not listen to him, but removed the head and follower, and found the rings, springs and screws entirely decayed. Thus, with wood at \$8 per cord, that cheap engineer had cost the company at least \$4,800 per annum, for the last three years, more than a competent, skillful mechanic would have cost them. He would work for \$75 per month, while a mechanic exacted \$100.

My employer recently asked me if I had

tallow enough to last me through the night. I told him no; thereupon we jumped a rock-breaker about the mill, who informed employer that when he ran a steam engine he used coal oil in the cylinder. Employer twisted his nose and replied, "I want no coal oil about my cylinder." It was perfectly absurd, for nearly all the oil would have become a gas immediately on entering the cylinder.

There is another very important item connected with running an engine with care, economy, and safety,—and that is *lubrication*. Many men will put as much oil on a journal two inches in diameter, making twenty revolutions per minute, as others will on an 8-inch journal making eighty-five revolutions per minute; and it is more than probable that the man using the most oil will have hot journals.

I have seen an oiler on board the Golden City, between San Francisco and Panama, with her 105¼-inch diameter and 12-foot stroke cylinder, making from 13 to 14 revolutions per minute, and a pair of engines turning 90 revolutions per minute, keep everything cool with less than one pint of oil. I have seen others on the same ship, with equal advantages, use three pints of oil, and then retire from watch with hot journals, burning the water from the hose, frequently used for cooling them.

The use and abuse of tools is another item. Many engineers will use a monkey-wrench to set up a key, or to chip with; will take a hammer to lighten or loose a finished nut, and slap their gauge-cocks with a fire-shovel, to find water.

Fuel is a great expense in California, and also in the State of Nevada. Even when the works are in a forest, labor being high and feed for animals scarce, it behooves the mill-owner to devise means for using as little fuel as possible. Many use the modern and improved engines,—Corliss's, Green's, Scott & Eckert's, Vulcan, etc., etc. They are all manufactured in this State, and thousands can vouch for their economy in fuel. I have frequently asked mill-owners why they did not use one of the above engines, as they save many cords of fuel in the course of a year. Poor fellows, their excuse was the difference of \$100 per annum between a mechanical and a shovel engineer. They punish themselves for their mistaken economy at the rate of 25 cents per day for every horse power, or from \$1,000 to \$10,000 per annum. They also forget that, even in the use of the common old-fashioned slide-valve engine, with a shovel engineer, they stop the mill many days in the course of a year, with broken cranks, pine, cylinder-heads, eccentrics, connections, cut cylinders, melted tubes, burnt crown-sheets and tube-sheets; sometimes by reason of too much water in the boilers, and at other times because there is none at all; sometimes because shafting and engine are out of line, or that the rabbit metal is all out of the boxes. Countless other things may also compel the owner to send for a machinist, and pay exorbitant prices for his services,—as we send for a physician to doctor our physical machinery, when it is deranged for want of proper care.

It often becomes apparent to a mill-owner that he should curtail his fuel bill; he gets a splendid Corliss engine to do his work. The machine of many days' labor is erected and makes its trial trip; it gives perfect satisfaction to him and the builders, and the mechanics who erected it return to the shop, and the shovel engineer takes charge of it. Soon the cylinder and valves are cut; then the unskilled engineer tampers with the valve connections and regulator,—and because it does not cut off to suit the miller or superintendent of the mill, the poor inventor or manufacturer gets a worse cursing than the shovel engineer ever gave his bulls, when following the vocation that his father brought him up to, on the old farm in the Eastern States.

Machinists and boiler-makers frequently congratulate themselves that men are employed in driving steam engines who are mechanically unable to keep up the repairs, and who therefore derange the machinery, blow up the boilers, etc. But it is a mistaken policy on their part; for many capitalists will not embark in steam enterprises, because they have so much fear of its many risks. The insurance companies want a great deal more money to take a risk where unskilled engineers are employed. In many instances they will not take a risk for any money, and the work of the skillful mechanic goes to wreck in less time than is consumed in its manufacture.

The poor farmer procures a portable engine at a cost of \$2,000, to thresh his grain. He goes to San Francisco, and finds a man, at an employment office, to run his engine for \$50 or \$75 per month. The engineer starts a fire under his boiler, and threshes grain until noon. Then all hands go into

the house to get their dinner, leaving the water low in the boiler, the safety valve tied down, and a heavy fire in the furnace. A spark falls into the loose straw; it spreads to the stack; the grain is all on fire in an instant; the boiler is strained and overheated, and in a few moments it goes off like a rocket. That poor farmer does not buy a threshing engine again, nor does his near neighbor. I could recite many such tales of practical, real truths, that have come under my observation since my advent in California, all resulting from utter ignorance and carelessness. As for boiler explosions, I never believed that a boiler ever exploded with one solid cock of water in it. I have seen 125 pounds of steam carried on a boiler that I have driven a tack hammer through at every blow. I know of an instance where a boiler that carried from eighty to one hundred pounds of steam daily, exploded, while but forty pounds were indicated only a moment before. The water was low, with a heavy fire under it; the engineer put his pump in motion, and the first turn of the pump dashing cold water on the heated plates, very few were left in that neighborhood to tell the tale. One instant before, the engineer had cautioned the proprietor to remove himself to a place of safety.

I contend that there ought to be as stringent laws enforced in the employment of stationary as of marine engineers, and that we should have a Board of Examiners in every county of the State to examine engineers and inspect boilers. Such a Board can be made self-sustaining without taxing the engineers or mill owners but a trifle; and even if it cost the State \$100,000 per annum, it would be worth millions in the additional security it would give to life and property.

I would refer mill-owners to the Industrial League, or to the various machine shops in San Francisco, if they want good engineers. No intemperate man should ever be trusted with the running of an engine. The Industrial League does not tolerate intemperance among its members, and they number thousands in this State.

For the sake of our sisters and brothers, fathers and mothers, let us be as careful in the selection of competent engineers as Mr. Bemis is in the selection of engineers to watch the massive magazines daily sailing or steaming out of the port of San Francisco, up and down the Pacific Coast, threading the muddy Sacramento and the crooked San Joaquin in the darkest nights with the most perfect safety. On all these boats the machinery is examined, and the engineers are responsible to the United States Government for the lives and safety of the passengers; and what is the difference between being blown up at sea or on the land? Our government protects us on the sea and river, but who protects us as we go down Market, First, Fremont or Clay streets in San Francisco? Very probably a Chinaman has charge of one boiler, two Indians another, no one the next, and a sore-nosed boy eleven years old the fourth. Thus it is that thousands of lives are placed in jeopardy daily all over this State.

FRANCIS L. HALL.

CORN, NOT GOLD.—It is not the gold, but the wheat crop of California that is now attracting so many laborers to our shores. The people of the Eastern States and Europe have seen the exultant jubiliations of our people over the extraordinary grain crops of 1866 and '67, and have heard of the demand for labor and of the gold paid for it in this State. They have also heard of our cheap and fertile lands, our delightful climate, and of the present low rates of fare. Hence, the present rush of laborers to our shores. Do our citizens realize the importance of promptly securing employment for these coming thousands? It will be disastrous for our State if we allow them to be disappointed in their expectations.

CANDLES FOR CARS.—Such a fear of kerosene has been excited by the Angola disaster, that the managers of the principal railroads in the Atlantic States have discarded it for use in cars, and substituted candles. Some States have made this compulsory by law. This is more in deference to public feeling, than from any real danger. It turns out that although it was reported that the horrors of that occurrence were aggravated by the burning kerosene from the broken lamps, the fact was that no kerosene was used in those cars, but they were lighted by candles.

"Natural Wealth of California."

We make the following extracts in reference to the iron ore deposits in this State, from the proof sheets of Cronise's forthcoming work, entitled the "Natural Wealth of California":—

The large and rapidly increasing consumption of iron in this State, together with the prospective requirements growing out of the construction of railroads and the present high prices of this material, render the question of home supply one of vital import. Deposits of ferruginous ores are known to exist in different parts of the State, but not generally under circumstances that would render their reduction profitable, or even practicable. Thus, there are numerous extensive beds in the Coast Range mountains, with others of less extent in the vicinity of San Francisco; but the absence of fuel, and often of sufficient water for smelting works, renders them of little or no value.

There is, however, a heavy accumulation of excellent ores at Gold Valley, Sierra county, situated under circumstances extremely favorable to large and cheap reduction, there being in the immediate vicinity an abundance of the finest timber and a sufficiency of water for all necessary purposes. These deposits, which are located about twelve miles east of Downville, in the neighborhood of the celebrated Sierra Buttes gold mines, are owned by the San Saba Iron Mining Company, incorporated with a view to prosecuting the work of their practical development.

The ores, at this point occur in a belt of metamorphic rock, being scattered over an area four miles wide and ten or twelve miles in length. They are of the magnetic variety, identical with that from which the best Swedish and Russian iron is made, and exist here under three different conditions: First, as an unmixed magnetic ore, so fine grained as to resemble the best of steel, and so pure that a large proportion of it will yield from sixty to sixty-five per cent. of metal. Then, there are masses of this magnetic ore mixed with carbonate of lime, while again it occurs associated with talcose slate, through which are diffused innumerable crystals of iron, the impurities in this case being of a kind not likely to interfere injuriously with the smelting process, while the carbonate of lime is present in about the proper quantity to supply the necessary flux. These two classes carry about fifty per cent. of the pure metal.

The deposits at this place furnish a notable instance of iron ores marked by an entire absence of arsenic, sulphur, phosphorus, and such other substances as tend to deteriorate the quality of the metal. The aggregate quantity of ore upon the tract owned by this company is immense; the outcrop of the ore chutes being from 50 to 250 feet long, from 20 to 200 feet wide, and projecting from twenty to fifty feet above the surface—it being estimated that a million and a half tons of first class ore can be removed from the surface deposits, worked as an open quarry.

The value of these mines is greatly enhanced by the facilities that exist for the reduction of their ores, being in the midst of heavy forests of pine and spruce, insuring cheap and unailing supplies of charcoal for smelting, fuel for generating steam for motive power, and lumber for building; while a number of small streams near by can be made to afford all the water necessary for the reduction works, and, during a portion of the year also, for the propulsion of machinery.

As regards a market for their product, these mines are favorably situated, being in and adjacent to extensive mining districts, wherein the consumption of iron, already large, will hereafter become greatly increased, while the price of the imported article must always remain high. Meantime, the facilities for transporting this product to points where required will be all the while increasing, as new wagon roads continue to be built throughout the country, while the construction of the projected Feather River railroad will afford additional advantages in this respect—the line of this road, by the route contemplated, running within a short distance of this company's property.

With such valuable deposits of ore, so favorably situated for cheap reduction—with very considerable markets at present, and such a large prospective demand—it is highly probable that the erection of smelting works, already projected by this company, will be consummated, and the business of manufacturing pig iron be entered upon at an early day. That, if once inaugurated, this enterprise will prove alike advantageous to the proprietors, and beneficial to the country, can scarcely be questioned.

Mechanical.

Steam Boilers.

The following is from the report of the Chief Engineer of the National Boiler Insurance Co. for 1867, as given by the *London Mining Journal*:

Long boilers strain considerably, and frequently give great trouble by leakage at the riveted seams. A fair proportion is when the length is about three and a half times the diameter. The staying of the end plates, and the attachment of the flue tubes to the ends, should be so arranged that the tubes may expand freely, unless there be some special arrangement in the form of the flue tubes to attain the same object. Many boilers, otherwise well made, have given considerable trouble by leakage and fracture, owing to the severe strains of unequal expansion, to which their rigid construction exposed them. In some of the boilers inspected the ends were so heavily stayed, and so rigid, that considerable leakage, and occasionally fracture at the ring seams of the lower part, resulted. In others the staying was so slight that the ends were bulged outwards, and serious risk of explosion thus incurred.

Flue tubes should never be stayed to the shell, but be attached at the ends only. The shell should be made quite circular, and the longitudinal seams, which should "break joint," be so arranged that when the boiler is set all those below the water line may be accessible for examination in the flues, and be clear of the brick seatings. Many makers now double-rivet these seams.

Multitubular boilers should, as far as practicable, be so constructed that every part of the interior may be accessible for cleaning and examination; and it would be a great improvement if those of portable and locomotive engines were so constructed that the tubes could be drawn without difficulty, so as to allow occasional inspection of the internal surface of the plates. External flues are necessary to stationary cylindrical boilers of this class, otherwise the lower seams are strained and become leaky through excessive unequal expansion of the boiler. Plain cylindrical externally-fired boilers, with egg or saucer-shaped ends, can never work so safely as a properly constructed internally-fired boiler, as they are so liable to fracture at the seams over the furnace, through the excessive alternate expansion and contraction to which they are exposed. The application of stout longitudinal stays would add materially to the safety of such boilers.

A large number of cylindrical vertical boilers are used in various ironworks; they are generally heated from the "puddling" or similar furnaces, the heat first entering the external flues, and passing thence by an internal descending flue-tube to the chimney. They are especially liable to starting and fracture of the riveted seams opposite the furnace necks, owing to the intense heat at that point; and where the feed water deposits much sediment the solid plate is sometimes fractured. To avoid this liability, the part referred to should be protected by a screen of brickwork, or the boiler set at a higher level, that brickwork may be so arranged as to spread the heat before it reaches the boiler. The bottoms of these boilers are frequently quite inaccessible for examination, and serious corrosion may go on unknown to those in charge.

In setting boilers, special care should be taken to thoroughly drain the ground, that no dampness may exist in the flues to cause corrosion of the plates. All the flues should be large enough to allow a man to pass through, so that every part may be accessible for examination. Midfeather seatings are very objectionable, and no boiler should be so set except those of very small diameter, and in such cases thick but narrow iron plates should be placed on the top of the brickwork to protect the boiler. Cylindrical boilers, internally fired, should be set on side walls, the boiler resting on fire-clay blocks made for the purpose, and so shaped that when built in place the bottom of the side flues may be much lower than the point where the boiler rests on the blocks. If the blocks be properly fitted to the plates that the bearing thereon may be equalized, the total breadth of both side walls where in contact with the plates need not exceed one inch for each foot of diameter of the boiler. The top of the side flues should be level with the crown of the flue tubes. All boilers should be roofed over to protect them from external moisture, otherwise the sides in contact with the flue brickwork will be weakened by corrosion.

THE COLORING OF BRASS.—Polished brass so easily tarnishes, that scientific instruments are now almost always bronzed. The *Engineer* gives some of the methods adopted for giving different colors to brass. We condense its remarks as follows: An orange tint, inclining to gold, is produced by plunging the polished brass for a few seconds into a neutral solution of crystallized acetate of copper. The solution must be warm, and contain no free acid. A beautiful violet is obtained by immersing for an instant in a solution of chloride of antimony, and then rubbing with a stick covered with cotton. In this case, the brass should be heated so as to be just tolerable to the touch. A *moiré* may be produced by boiling in a solution of sulphate of copper. The tints vary according to the proportions of zinc and copper in the alloy. To bring out the wavy appearance of the *moiré*, friction with a resinous or waxy varnish is sometimes necessary. This is also increased by dropping a few iron nails into the bath. A black lacquer is produced by polishing with tripoli, and then washing with a mixture composed of one part nitrate of tin and two parts chloride of gold. After a quarter of an hour this wash is to be wiped off with a linen cloth.

A LAD'S INVENTION.—We clip the following from the *London Mining Journal* of Feb. 15th: A few months ago, considerable attention was excited by the announcement that a young gentleman, about twelve or thirteen years of age, had obtained a patent for certain improvements in steam-engines. The invention was submitted to public investigation at some house in Holborn, and the representatives of the press repaired thither to avail themselves of the opportunity thus afforded to them of becoming acquainted with a new step in the progress of the useful arts. They found a very agreeable, intelligent young gentleman, ready to explain his invention to them, and perfectly competent to do so. The matter is of sufficient importance to justify a description, as the final specification has recently been printed. Master Franklin's invention relates to steam-engines in which two cylinders are employed, the pistons of which are connected with one crank-shaft; and the invention consists in so arranging the engine that the steam only acts on each piston to move it in one direction, so that, if two cylinders be employed, the pressure of the steam will be acting on the piston of one cylinder, and thus turn the crank-shaft, while the piston of the other cylinder is being moved back without being acted on by the pressure of the steam; the cylinders are left open at one end.

CEMENT.—A cement particularly adapted for attaching the brass work to petroleum lamps, is made by Puscher, by boiling three parts resin with one of caustic soda and five of water. The composition is then mixed with half its weight of plaster of paris, and sets firmly in half to three-quarters of an hour. It is said to be of great adhesive power, not permeable to petroleum, a low conductor of heat, and not superficially attacked by hot water. Zinc white, white lead, or precipitated chalk may be substituted for plaster, but hardens more slowly.

If the above, which we clip from an exchange, is reliable, it would seem to be just the thing for the lining of barrels to be used for coal oil. For aquariums, also, it would be well adapted.

BESSEMER STEEL IN PENNSYLVANIA.—The Pennsylvania steel works, at Baldwin, near Harrisburg, are now making four heats, or about fifteen tons of Bessemer steel per day, and give employment to one hundred hands. The steel is shipped to the Cambria iron works at Johnstown, where it is manufactured into steel rails. The steel company have probably by this time a rolling mill in operation, for the manufacture of steel rails.

THE BROOKS INSULATOR IN FRANCE.—This American invention has been pronounced by a French commission superior to all others exhibited in Paris. It is an iron hook, cemented into an elongated glass vase. This vase is cemented into a hollow cast cylinder, and the whole saturated with paraffine. The French Government has sent Mr. Brooks a very delicate differential galvanometer, to test the insulators which he is making for the French telegraph.

Scientific Miscellany.

THE ELECTRICAL PHENOMENA OF JANUARY 9TH.—Our readers will recollect the mention made in our issue of February 29th, of the remarkable appearances observed in the Rochester telegraph office. The same were also observed in the Buffalo and Cleveland offices. A writer in the *Tribune* of March 11th, thus speaks of them in connection with the sun-spots noticed at the same time: "From sketches of a group of sun-spots, observed between the 6th and 11th of January, it appears that interesting changes took place on the 9th inst. The observations were made at 9 A. M. and 4 P. M. One part of the group appeared to have performed a *retrograde rotation*, toward the central and largest spot. The motion was very rapid, estimated at about 300 miles an hour, in a direction contrary to the sun's rotation. The large central spot had rotated in a similar direction, with a velocity much slower than the smaller spots. The phenomena did not seem accounted for by the apparent change of place of the group by the sun's rotation, and consequent change in perspective. It does not seem improbable, therefore, that the recent phenomenon may have owed its origin directly to an electrical influence from these spots upon the crust of the earth, or to an electrical disturbance of the atmosphere brought about through these spots without the usual accompanying phenomenon of Aurora Borealis. If, as has been conjectured, the sun revolves in a vast electrical current, the friction of its enormous surface between a positive and negative pole would doubtless be sufficient to produce the light and heat given out by that fiery orb. It would not be difficult to believe the spots on its surface caused by special currents of electricity to and from the various large bodies of our system, and perhaps in part by the especially attractive nature of metallic scoriae floating upon the liquid surface below. Sun-spots are frequently seen with a core of intense blackness than the surrounding dark portions of the *umbræ*, as they are called. This black core, known as the *nucleus*, if seen in space would very possibly be too bright to be regarded with impunity. Both nucleus and umbra are thought to appear black as an effect of contrast with the dazzling electric light of the solar photosphere. The question suggests itself, may not this dark nucleus indicate the solid portion of the spot, and the seat of disturbance in some of the electrical phenomena which are from time to time witnessed in our earth, and cannot be accounted for in other ways? The speculation possesses no little interest."

EXPLOSION OF AN OXYGEN RESERVOIR.—Dr. Wilkinson sends the *Journal of the Franklin Institute* the following account of an explosion of a large copper flask used for preparing oxygen. Two or three pounds of the oxygen mixture was put into the flask, which holds about four quarts; the cap being secured tightly, it was placed on a furnace upon a bed of hot coals, an india rubber tube attaching it to a bag of the same material. It took some time before the gas commenced to make. When it did come, the flask was red-hot; then it came off freely. Just as it was about ceasing, a tremendous explosion occurred, throwing a large 12-foot table to the ceiling, smashing every pane of glass in the laboratory, hursting open all the doors, and throwing the operator, Mr. Zineker, through a door into an adjoining room. The exact composition of the explosive mixture which was formed, is doubtful. "Although," says Dr. W., "oxygen is often made in a glass flask with impunity,—when a metallic flask is used, the gas is raised to a temperature of nearly 1,100°;—sufficient to decompose the hydro-carbon of which the bags are composed. Passing the gas through a wash-bottle would prevent such an accident."

THE MASTODON IN INDIANA.—At a meeting of the Chicago Academy of Sciences in November last, Dr. Meyers described the finding of the bones of the mastodon presented by him to the Academy. The locality was discovered by a farmer named Trush, in Noble county, Indiana, while digging a drain. Dr. Meyers purchased the bones already found, and also the privilege of making further explorations. He associated with himself Dr. Stimpson, of Chicago, and the two spent several days in superintending the excavations. They were rewarded by the finding of three skeletons; one of which was of a young animal, and two of which were so nearly perfect that they could be mounted. They lay at the depth of four or five feet, in a stratum of peat overlying blue clay containing lacustrine shells. The place was a recently-drained swamp. Among the bones were found several fragments of tree branches, some of which had been gnawed by the beaver. Ancient heaven-dams are abundant in the region.

THE MASTODON IN KANSAS.—John D. Parker, of Topeka, Kansas, sends the *American Naturalist* a photograph of a vertebra from a skeleton said to be imbedded in the mud of a stream in that region, where explorations are just now unsafe, on account of Indians. One rib has been detached and ground up into powder by the savages, for medicine. The vertebra was examined by Prof. Wymau, who pronounces it that of a mastodon.

HYDRIODIC ACID.—Prof. Winkler uses the following improved process in order to avoid loss of iodine, which is not uncommon in the official method, besides yielding an acid of much greater strength, if desired. Bisulphide of carbon is saturated with iodine in a tall cylinder or flask, and a sufficient quantity of water is poured on, according to the proposed strength of the acid. The tube from the sulphureted hydrogen apparatus reaches to the bottom of the cylinder, and the gas is decomposed in the same manner, while the sulphur as it separates dissolves in the bisulphide. As soon as the latter is decolorized, the current of gas is stopped, and the watery solution is separated from the oily solution of sulphur by means of a moistened filter. After heating it for a short time at the boiling point in a retort, the acid will be chemically pure, while the bisulphide is also recovered by simple distillation. For the preparation of hydrobromic acid this process is not applicable, because it is not possible to prevent, altogether, the formation of sulphide of bromine.—*Druggists' Circular*.

IODIDE AND BROMIDE OF SILVER.—*Aqua Ammonia* is the readiest means for distinguishing iodide and bromide of silver, the latter being quite readily soluble in ten or twenty times its bulk of ammonia, while iodide of silver at the ordinary temperature requires so large a quantity as to appear practically insoluble. On the other hand, while the iodide of potassium is readily dissolved by alcohol, the bromide of potassium is but slightly soluble. Nitrate of lead produces a yellow precipitate with iodide, and a white one with bromide of potassium. Corrosive sublimate gives no precipitate with the bromide, but the yellow or red one with iodide of potassium. They also differ somewhat in taste; the bromide resembling ordinary salt, while the iodide has an acrid, metallic, and somewhat bitter taste.—*Druggists' Circular*.

RUBIDIUM.—Rubidium is a white metal, brilliant and much resembling silver, although it has a scarcely perceptible tinge of yellow. It is more electro-positive than potassium, takes fire upon water, and burns with a flame that can scarcely be distinguished by the eye from potassium. It also burns with brilliancy in chlorine, and in the vapor of bromine, iodine, sulphur, and arsenic. In the air it oxidizes instantly to a bluish-gray suboxide and takes fire, after a few moments, more easily than potassium. At 10° Fah. it is soft like wax, at 58° it is like iron, and at 100° it melts, and at a red heat is converted into a blue vapor with a shade of green. Rubidium derives its name from the Latin word *rubidus*, "dark red,"—owing to the existence of two red lines of remarkably low refrangibility, which it produces in the spectrum. It is found in lepidolite;—and in the mother liquor of mineral waters.

A LAKE OF BOILING WATER.—The following is from the La Crosse, Wis., *Democrat* of Feb. 15th:—An explosion occurred at the artesian well that has been sunk to the depth of 280 feet, midway between the river and the bluffs. The drill had been working through a substratum of dark porous rock for five hours, and had been making rapid progress, when suddenly the machinery stopped, the rods became violently agitated, and a deafening explosion ensued, followed by a stream of boiling water, gushing with mighty force through the tube from the depths below. The upward pressure of the water is not less than 200 pounds to the square inch. The mean temperature is about 133 Reaumur. Hugh Miller mentions a similar case at Inverness, in Scotland, where boiling water has flowed for over seventy years, and also the famous hot well at Stuttgart, in the Hartz Mountains, in Germany. The Geysers, or boiling springs of Iceland, are no doubt operated by the same natural cause. Dr. Percival, late State Geologist, was of the opinion that far beneath the bed of the Mississippi there existed another stream flowing in the same direction, of much greater magnitude, and whose waters were of a much higher temperature than the waters of the river.

The well has been visited this afternoon by crowds of citizens, and the phenomenon has given rise to much speculation.

The extensive vineyards of Hon. Edwin Flint and George A. Metzgar are in imminent danger of being submerged by the boiling flood. The snow for a space of about six acres has entirely disappeared.

THE POPE AND MR. PEABODY.—A Rome letter says: George Peabody, with Hon. R. C. Winthrop, was presented to his Holiness last week by Mr. Hooker, late Secretary of the United States Legation. The Pope was fully aware of the character of his visitor, whom, with Messrs. Winthrop and Hooker, he requested to be seated in his presence, an unusual mark of distinction. A delicate token of Pio Nono's appreciation of Mr. Peabody's universal benevolence was afforded by the Latin quotations from Holy Writ, showing the blessed quality of charity, which he wrote with his own hand under some photographic likenesses of himself, which he presented to the party as souvenirs of the visit. On returning from the Pope's audience, Mr. Hooker presented his friends to Cardinal Antonelli. The conversation turned on the hospital of San Spirito, among other charitable institutions, and Mr. Peabody no sooner returned to his hotel than he forwarded a check for 1,000*fr.* to the cardinal in aid of the hospital's funds.

PETROLEUM FOR STEAM FUEL.—Preparations are being made in this city to give a thorough, practical trial to test the value of petroleum for steam fuel. The California Steam Navigation Co's steamer *Amelia*, plying between this city and Napa, is being fitted up with Foote's apparatus; while Capt. White's apparatus is being placed upon one of the city steam fire engines. Another of the latter is in process of construction at the *Ætna* foundry, to be used under the boilers employed for driving the machinery of that establishment. The result of these several experiments can scarcely fail to give a pretty satisfactory conclusion to this much-talked-of problem. Experienced engineers who have seen the preliminary trials, already noticed, express much confidence in the full success of the enterprise.

TEN DAYS TO NEW YORK.—By contracts already entered upon, it is stated that the Union and Pacific Railroad Companies will have their rails laid, on or before January next, to points which will leave but 512 miles to complete the connection. This gap will be filled by stage inside of three days' time, so that we may reasonably hope to be able to make the distance between San Francisco and New York in ten days, by the first of January next.

DISAPPEARANCE OF A LAKE.—An exchange tells us that the water of Ottawa Lake, in Monroe County, Michigan, has recently disappeared. The teamsters noticed that the holes in the ice where they watered their cattle, were crowded with fish. The usual work was abandoned, and hundreds of men with axes and crow-bars were soon busily engaged in cutting and raising huge pieces of ice, and then lifting the fish, some of which were dead, some alive, and some frozen fast in the ice, for the water having departed from the lake by some subterranean passage, the vast sheet of ice lay on the bottom. For three days immense quantities of fish were carried away, principally pickerel and bass, while vast quantities of white fish were left to rot on the ice and in the mud,—for mud and ice are all that is left of Ottawa Lake. Numerous pieces of the ice are left standing on edge, like so many gravestones. The lake, or rather its bed, or graveyard, presents a novel scene. Some say the water will return by the same source by which it departed, bringing a fresh supply of fish with it—for Lake Erie is supposed to be its headquarters. Meantime the farmers in the vicinity greatly feel the loss of the departed waters. About seven years ago this lake departed in the same way, and old men say it departs and returns periodically.

ANTHRACITE GUNPOWDER.—A patent for this article has been taken out by Ehrhardt of London. It is composed of nitrate and chlorate of potash with mineral carbon. It is said to burn slowly in the open air, like common gunpowder when wet; but if confined, it explodes with great force. The coal preferred for its manufacture is anthracite. Nitrate of soda may be used instead of nitrate of potash. The proportions used vary according to the purpose for which it is intended. For blasting granite or other hard rock, one part of chlorate of potash, two of nitrate, and three parts of coal are used.

NEW THEORY OF METEORIC SHOWERS.—Sir John Herschel has recently advanced the theory, not wholly new, but never before supported by well known facts, that meteoric showers are simply the light caused by the collision of the earth's atmosphere with the tenuous substance of a comet. Prof. Adams, who shared with Leverrier the credit of discovering the planet Neptune, not only accepts this theory, but attempts to establish the identity of the comet through which the earth recently passed, with Tailor's comet, whose orbit apparently coincides with that which, if a comet, the recent visitor would have taken.

ATOMIC AND COMBINING WEIGHTS.—In a new text book of Inorganic Chemistry, recently published by Messrs. Eliot and Storer, Professors in the Massachusetts Institute of Technology, the atomic weights are not given as the combining weights. With the exception of those for H, K, Na, Li, Cs, Rh, Ag, P, As, Sb, N, Bo, Fl, Cl Br, I, the old combining weights must be doubled to become atomic weights.

HUNTER'S POINT DRY DOCK.—All the machinery for the Dry Dock at Hunter's Point is in place, and steam was got up for the first time yesterday to make a trial of the pumps. A large force of men will be set to work excavating at the mouth of the dock. The bad weather has hindered operations for weeks, but the work is now going on again rapidly.

ROBERTSON'S RAILROAD TRACK LAYING MACHINE was to have had a thorough practical trial upon the Sacramento and Vallejo road during the past week. Railroad men manifest much interest in the success of the experiments.

CALIFORNIA LABOR EXCHANGE.—The Trustees of this association held their first meeting under the organization on Wednesday. Arrangements will soon be made to open an office and attend to business.

Weekly Stock Circular.

By Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,
April 18, 1883.
Financial.

Our domestic money market exhibits renewed activity, the result of legitimate demand for money, growing out of spring trade requirements. We quote 1 per cent. per month as being the figure at which the savings and loan associations are affording accommodations, repayable in instalments. Good paper is done at 1½ per cent. per month. Long loans are effected at 10½ per cent. per year. Bullion is in greater supply, and prices show a considerable recession within the past month. Of late the margin required upon mining stock collaterals has been somewhat extended, and security of this nature has not been quite so acceptable to our banking institutions; however, the rates upon which advances are obtained are far from those ruling during the excitement of a few years ago. We quote the range at from 1¼ to 2 per cent., the greater proportion being done at 1½ per cent.

The *Stockton Herald* says that the stockholders of the Stockton Savings and Loan Society held a meeting on April 4th, for the purpose of taking the proposition to increase the capital stock of the company into consideration. It was unanimously voted to increase the stock one hundred and fifty thousand dollars, so that now the capital stock of the company stands at a quarter of a million of dollars, in 2,500 shares of \$100 each. The affairs of the Society are in a highly flourishing condition.

City Stocks.

During the week under review, we note considerable sales of Spring Valley Water Company stock, at \$64 50@65. Early in the week, Sutter Street Railroad commanded \$11 50 seller 30, and San Francisco Gas Company \$75 per share. In addition to the local incorporations mentioned in our last issue, that have disbursed dividends the present month, we mention the following: California Marine Insurance Company, 2 per cent. per month for the quarter ending March 31st, payable since 15th inst.; Fireman's Fund Insurance Company, 1 per cent. per month for the same period, payable on the 20th inst.; California Steam Navigation Company, 1½ per cent. due since the 15th inst. The Omnibus Railroad Company paid a dividend of ¼ per cent. on their capital stock on the 15th inst., being the first disbursement of a like nature since September, 1867.

The Bank of California disbursed its usual dividend—1 per cent. per month—on its capital stock, on the 15th inst.

G. W. Mowe, Esq., of Sacramento, has been nominated Insurance Commissioner by the Insurance Companies, and the Governor has endorsed their selection. The law takes immediate effect.

Mining Share Market.

Since our last issue, the mining share market has been exceedingly active, and nearly every stock on the list met with a serious decline. This was mainly superinduced by the announcement that the drift from the Imperial-Empire shaft had passed the point where it was expected the ledge would be encountered, thereby affecting the whole list. The recent rise was mainly dependent upon the prospective developments of this shaft, and the disappointment at present is very general; however, it is unquestionable that all masterly deep-assured veins, as stated in our annual review, to which class the Comstock belongs, are known to be more or less marked by certain eccentricities, not only in the line of their strike, but also in the disposition of their ore channels. All mining experience in other countries and the science of geology teach this to be true. Reasoning by analogy, then, we may expect the same thing to occur in this as in other veins of great power. But from the same sources we learn that these mother veins maintain the continuity of their ore bearing channels to the greatest attainable depths. These sometimes suffer serious displacement and local interruptions, but never cease to exist nor are wholly lost. As in the case of the Comstock, the mass of ore usually increases in bulk, but diminishes in richness somewhat, when certain points beneath the surface are reached; after which it remains nearly the same, rarely ever, as experience shows, becoming exhausted, or shifting wholly beyond reach. Keeping these precedents in view, and relying on the teachings of science, our faith remains firm in the persistence of the ore channels and the continued productivity of the Veta Madre of Nevada.

At the close, in the afternoon session, a sharp reaction took place, and Imperial, Alpha, Overman, etc., exhibited a very decided advance over sales at the morning session. It is to be hoped they have reached the vein in the Imperial drift.

Returns of bullion from Nevada for March foot up to the handsome amount of \$1,019,000 in round numbers. Of this sum \$771,000 was received from Storey county; from Austin we received \$203,000; and Orona and other points in Humboldt sent us \$35,000. Considering the almost impassable condition of the roads, the above is a very gratifying exhibit of the wealth which the mines of Nevada are capable of supplying. With the return of fine weather and improved traveling, the gold and silver stream will undoubtedly be quickened and enlarged. The miners will also have a far better opportunity to unearth and develop the treasures of their various claims, work in many having been much retarded by the severity of the past winter. Prospects for the present year are more encouraging, and mines will be worked which last year were suffered to be idle. Renewed vigor and activity must ensue upon the enlarged and lucrative field of operations resolved upon, and some of which are already commenced.

At Silver City, Idaho Territory, the Revenue Assessor makes returns of \$142,516 as the amount of bullion assayed in that place during the month of March.

In the comparative table published in our last issue we find that the combined aggregates for the first quarters of 1866, 1867 and 1868 are as follows:

Bullion produced.....	\$6,528,368
Dividends.....	1,224,890
Assessments.....	1,262,880

SAVAGE—exhibited considerable activity under a material decline, receding from \$175 to \$154, and at the close selling at \$162. During the week ending April 11th, the mine yielded 1,453 tons of ore, valued at \$39 44 per ton, against 1,447 tons, valued at \$29 22 per ton, the previous week. During the period under review, the Potosi chimney, on the fifth and sixth floors above the third station, yielded some fine ore, which greatly assisted in bringing up the above average value. In the south mine, on the fourth level, the breasts are reported to look well, but the ore is not so good a quality as found in levels above. The south drift is about forty feet from the line, still carrying good ore in the face. The winze to the fifth station is down upwards of eighty-five feet on the incline, and it is not looking so well as formerly. On the fifth station the south drift had fine ore until recently; now the face is reported to be quite poor.

CROWN POINT—met with the usual inquiry, advancing from \$2,100 to \$2,290, dropping to \$2,090, and at the close realizing \$2,250. A telegram from the 17th inst., says: "No improvement in drift; north and south on east body great improvement—looks encouraging; eight feet of good average ore." The south drift, on 700 level, does not look as well as formerly, but overhead it continues to look fine on all the floors. The first clean-up for April from two mills is at hand, amounting to \$30,000, with two other mills for same time yet to hear from. The average yield is about \$40 to the ton.

IMPERIAL—became quite active toward the close of the week, selling at a marked decline, falling from \$208 to \$210, rallying to \$243, and closing at \$270. On the 13th inst., the drift from the shaft, on the 900 level, was in 140 feet, without any favorable developments. On the 17th, the drift showed no change, requiring blasting to extract the porphyry. The receipts of bullion to date for April account foot up \$12,491.

OVERMAN—was also seriously affected by the general recession, opening at \$221 50, gradually dropping to \$150 under large sales, and closing at \$175. Nothing of importance from the mine. **GOLD HILL QUARTZ** receded from \$150, assessment of \$30 delinquent, to \$110. The 450 level is at present furnishing all the ore, which appears to be plenty and somewhat better. The recent yield of 110 tons amounted to \$19 41 per ton.

KENTUCK—was less inquired for than the previous week, selling within a range of \$487 50@490, and at the close obtaining \$460. The receipts of bullion on April account reach \$26,247. A dividend of \$10 per share is payable since the 15th inst.

GOULN & CURRY—declined from \$670 to \$535, and closed at \$600. The accumulated product of this mine has been sold to outside parties instead of reducing the same at their own mill. We learn that David Bowie, the present efficient Secretary of the company in this city, will take entire charge of affairs at Virginia about the first of next month, Mr. Janin, the Superintendent, having resigned his position. The bullion receipts during the first three months of 1868 amounted to \$14,476, the same coming to hand early in January.

CHOLLAR-POTOSI—opened at \$320@327 50, rapidly declined to \$250, and closed at \$275. For the week ending April 9th, the ore product amounted to 423 tons, and with the exception of 22 tons from the old Santa Fé level, came from the Blue Wing level. The latter level shows no improvement, and work on the north Santa Fé has been suspended. It is said that the rock on the bottom of the shaft has changed, and sinking is much easier.

HALE & NORONHO—is quiet; sold at \$2400 seller 30. The actual bullion returns for March foot up \$90,937 24. The present yield of the mine shows a 65 per cent. assay value of about \$30 to the ton. On the 15th inst. the shaft had been sunk and timbered to a further depth of 72 feet.

EMPIRE—was dealt in more than usual, dropping from \$325 to \$225, and at the close sold at \$250. The drift has been carried forward 156 feet, showing no favorable developments. According to estimates this is already beyond where it was thought the vein would be reached.

OPHIR—declined from \$202 50 to \$190, and closed at \$214. Sinking in the new shaft has been progressing steadily since the 10th inst., and the machinery works admirably; the rock is hard but shelly, and very easy to sink in. The back water has pretty well drained in, but the pump is at present discharging 8,000 gallons per hour—its capacity being 15,000 gallons when working steadily. The depth to be attained before drifting was fixed by the Board at 600 feet and no change in this respect has been determined on. The expenses of this company are very light, averaging since December but \$7,000 per month, at which rate it will take some time yet to exhaust their cash balance. Depth of shaft, 190 feet.

SILVERA NEVADA—sold at \$30@18. An assessment of \$10 per share was levied on the 14th inst. **UNITED STATES M. Co.** sold at \$20@22 50. An assessment of \$3 per share was levied on this stock on the 11th inst.

The sales in the Board during the past week have been as follows: Regular sessions, \$2,211,025; open sessions, \$305,047—total, \$2,516,072; and since the first instant, aggregate \$7,587,259.

ACROSS THE SUMMIT.—A *Tribune's* Omaha special says that the Union Pacific Railroad crossed the summit of the Rocky Mountains yesterday (17th). The rails on the summit were laid by T. C. Durant, Vice President; Sydney Dillon, Director; Gen. Dodge, the Chief Engineer, and other officers of the Company, assisted by a number of army officers.

NORTHWEST COAST SURVEY.—The U. S. steamer *Saguaw* will be engaged this summer in making surveys along the shore of Alaska, and the islands recently acquired from Russia. She will sail on Monday next.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Chronicle, April 4th: A spur of good ore about six inches wide was struck in the Pennsylvania tunnel yesterday. They feel satisfied their ledge is not far off.

The Rippon tunnel during the past few days has been passing through a strata of fair looking quartz, and the workmen are now somewhat impeded in their labors by an influx of water. The indications for striking their ledge within a short time are very flattering.

Amador County.

Jackson Ledger, April 11th: The result of rock worked at the Coney & Bigelow mill, from the Kennedy mine, in returns exceeded the most sanguine expectations of the proprietors. They took their rock from a tunnel 90 feet south of the old shaft. At this point they have from 6 to 8 feet of solid ledge, and strata of rock to the width of 16 feet. This was taken out promiscuously for the purpose of giving the mine a general test before putting on permanent improvements. Since the most favorable returns they have decided to go on as previously arranged.

Another proof that the placer mines have not yet "petered," is that F. A. Serine and George Hutchinson, near Pine Grove, have been panning out from \$5 to \$50 per day for the last month, and feel confident that there is plenty of the same dirt left. There is no telling what they might have made by sluicing. One piece, weighing over \$40, and several half-ounce *chispas*, looked exceedingly tempting.

The Amador Mining Co., formerly known as the Eureka, at Sutter Creek in this county, has declared their usual dividend of \$6 per share, for the month of March, payable on the 7th, and an extra dividend of the same amount, payable on the 10th, making in the aggregate the handsome sum of \$52.440.

The B. B. M. Co. are progressing rapidly with their work. They have passed through the raise in the hard rock, and the ground being easily worked a drift will be run at this point. The water is about the same as last week.

The editor calls the attention of persons desiring to purchase mines, to the Moore mine, one mile south of the Coney & Bigelow claim, as one likely to well repay its owners. It is for sale.

Calaveras County.

Chronicle, April 11th: Like the generality of mining camps at this season of the year, Rich Gulch is dull, but the prospects for the future are flattering. Quite a number of gravel claims are being worked and paying well. Work on the quartz leads in that vicinity, has not been commenced this spring, but active preparations are being made, and the coming season will develop the fact that Rich Gulch is on the great quartz belt which extends nearly through the State. Miners in that locality are energetic and industrious, and with the assistance of the capital promised, success is certain.

At Railroad Flat, acres upon acres have been washed away, and yet the work has but fairly commenced; 160 inches of water are used. Operations in quartz are being actively pushed forward in that locality. Mr. Said, who purchased the famous "Petticoat lead," has erected steam hoisting works, and has a large number of hands at work in the mine. The shaft has reached the depth of 30 feet, and the rock being taken out will pay at the rate of \$100 per ton. Mr. Said will prospect the lead until satisfied in regard to its extent and richness before erecting a mill. A large number of claims are being successfully worked in that vicinity. The "New York boys," Post & Co., Quedell & Co., and others, are obtaining flattering prospects.

On Saturday last we were shown the amalgam taken from six tons of "Petticoat" quartz, at Railroad Flat. It assayed \$612.

The Mokelumne Hill correspondent writes: The Wet Gulch and Chaparral claims are peculiar, the country rock on one side being limestone, and on the other syenite. The pay sbute or chimney extends over 3,400 feet of the vein, prospecting alike throughout this distance. They have a shaft on a part of the claim called the Chaparral, that is 130 feet in depth. At this depth the vein is 7 feet thick, and what is better than size, is that it is all pay rock. A few tons of the average rock was taken at a heavy expense to Harris' mill, at Sandy Gulch, a distance of 20 miles, part of the way on the backs of mules, which yielded \$22 per ton.

The Carson correspondent of the *San Andreas Register*, of April 11th, says: Everything here is as "dull as a hoe." Gabriel's mill is the only one in motion, and last week he made a good clean up. The Union mine has not yet squared the yards, but I think will soon do so.

Mariposa County.

Gazette, April 10th: The mill recently erected by Bogan & Kerrins, on Bear Creek, is now completed, and in successful operation. Water is the motive power of this mill, and works eight 650-lb stamps, making 60 strokes per minute, and capable of crushing 10 tons of rock every 24 hours, and this ponderous machinery is kept in motion by a small wheel about the size of a man's ordinary broad-brim hat. The vein from which the rock is procured, is a very promising one, being well defined, with perfect walls, and from one to two and one-half feet in thickness. The rock is estimated to yield not less than from \$12 to \$15 per ton. The mill is under the superintendence of Messrs. Snooks and Rogers, gentlemen of long experience in the business, and perfectly familiar with quartz mill operations.

Nevada County.

Transcript, April 7th: Brown's cement mill started up again yesterday, running upon excellent cement, and the companies engaged in this kind of mining are doing well. A number of gravel mines have started up and others will soon follow. The miners of this locality look forward to a lively and profitable season.

April 9th: The Pittsburg mill started up yesterday on a splendid lot of ore, and rock now coming from the mine is very rich. S. D. Merchant, the Supt., made some tests of the giant blasting powder and found it to work well.

April 14th: The Welsh Co., at Relief Hill, have struck the gravel channel for which all the companies in that locality have been prospecting, and the gravel pays as high as \$5 per car load. Four large companies are at work in this locality, and the success of the Welsh Co. has greatly encouraged the remainder and given new life to the place. The deep snow and heavy storms have impeded mining operations considerably during the winter in this locality. The miners hope for good weather and confidently expect large returns as soon as it comes.

Gazette, April 8th: Two loads of iron pipe passed through town yesterday, having been brought up from Timbuctoo for Weston, Holmes & Co., mining near Blue Tent. The owners are carrying on extensive mining operations at Timbuctoo, and last year they purchased the claims of the Gopher Co., on which they will commence piping as soon as the hydraulic apparatus can be put up. The pipes are 15 in. in diameter, and they purpose using 400 to 500 in. of water; besides, they will do much of the work of loosening and breaking down the banks of auriferous gravel by means of powder. One of the owners informs us that the Gopher claims prospect much better than their claims at Timbuctoo.

April 14th: The North San Juan correspondent writes that the miners in that locality are all engaged, and have hopes of large remunerations for their labor.

Some weeks ago a miner named Jos. Lopez, known here as "Portuguese Joe," struck an immensely rich pocket of decomposed quartz while running a cut in the bed rock, near the old Excelsior sawmill, on Rush Creek. We learn that he has taken out in the course of three weeks some \$30,000, and then sold the claim for \$7,000. One pan of the decomposed quartz is said to have yielded \$1,100. The quartz ledges on Rush Creek and the region round about are noted for their rich pockets, though as yet none of the ledges have paid for working regularly.

The South Yuba Canal Co. have reduced the charges for water on their line of ditches to 17 cts. an inch for 24 hours, day and night, 10 cts. for 10 hours, day water, and nine cents for 14 hours at night.

Grass Valley *National*, April 7th: The Dromedary mine which has been lying idle for a month or so, because of the difficulty of getting wood, will start up in a few weeks. The ledge in the Dromedary when the workmen left off was exceedingly rich.

April 9th: The dividing ridge between Wolf Creek and Deer Creek is attracting much attention on the part of miners. The Banner mine and the Whigham are on the northern slope, and the Norridgecock and McClellan are on the southern slope. The Eureka ledge is on the Wolf Creek side, and arrangements are about being made to run a tunnel from the level of that creek, so as to work the ledge at a great depth. It is also probable that the Annita Co., which owns the north extension of the Eureka, will run a tunnel from the Deer Creek side, and the two meeting together

will form a tunnel of 3,800 ft. in length, running in quartz throughout the whole distance.

April 10th: Yesterday Wm. B. Smart, who seems horn to good luck, picked up a piece of gold which was worth \$6, and today, at the head of Pike Flat, he found a specimen worth \$70. From the specimen found to-day he broke a small piece which he sold for \$20, to Harry Roberts, who crushed it and got \$26.50. The whole realized him \$70.

Grass Valley *Union*, April 7th: We observe many teams engaged in hauling quartz through the streets, from the mines to the mills. The strike at the Idaho, and a later one on Weimar Hill have given the prospecting interest of our town a sudden and healthy revival.

April 11th: A correspondent writes from Graniteville district as follows: At the Birchville mine there is seven ft. of snow. The tunnel of this company is now in 268 ft., and the rock is becoming more soft. For the last 50 ft. it has been pretty hard, though not sufficiently so to prevent being taken down by picking. So far no blasting has been required in the tunnel. The Jim which has been recently incorporated under the name of the Mutual Co., are making preparation to start their mill and mine, and will commence operations within two weeks. Their rock shows free gold, pretty freely. The Grizzly, at the head of Devil's Cañon, will, as soon as they can get in the balance of their machinery, finish their steam mill. They have been taking out rock all the winter, and will have a fine supply of ore to commence on in the spring.

The snow at Moore's Flat has almost gone, and the gravel companies have commenced work. Among these may be mentioned the St. Lawrence, the Illinois, the Piute and Hickey's. They are washing away in good earnest. For the last two weeks the boys have been helping the Kentucky Shaft Co. to forward their pump to Snow Point. At Wolsey's Flat, a mile below this, washing has been commenced on two or three claims.

Marks & Co. are running their claims, which adjoin the Boston, and we expect, when they make their clean up, to hear of great results.

EXCELSIOR.—The Grass Valley *National* of April 11th, learns the following concerning the mines at Meadow Lake. The weather has not been excessively cold. Eighty or a hundred persons have spent the winter at Meadow Lake. In the way of mining, work has been carried on all winter in the Mohawk and Montreal, Empire, U. S. Grant, and Kentucky. The first named company have had 15 or 20 men at work in their mine, and during the entire winter the work was interrupted but a few days. A track and chute to carry rock from the mine to the mill, which had cost \$3,000, was blown down in the early part of the winter. The damage will be repaired at an early day, when they will commence crushing, the mill having been kept in good repair. The Empire mine has also been yielding excellent ore.

Dutch Flat *Enquirer*, April 11th: We learn that the Empire Co. at Meadow Lake are taking out some splendid ore. It is described as sulphuretted rock, heavily loaded with gold. The snow is said to be not more than 17 ft. deep.

Placer County.

Dutch Flat *Enquirer*, April 11th: The Home Ticket Co., at Gold Run, cleaned up last week, after 19 days run \$2,500. The company are using 250 inches of water. They will work steadily as long as water lasts.

After a run of 15 days and nights, Taylor & Co. cleaned up the nice little "stake" of \$6,080. They use 400 inches of water.

About 150 feet of the Yuba Ditch washed away last week, but has since been thoroughly repaired and is now running full.

Kinder & Co. of Gold Run, after a run of 20 days cleaned up the sum of \$3,000.

Grass Valley *National*, April 4th: Cement claims in some portion of Placer County are seemingly in a depressed condition. Out of the four mills erected between Todd's Valley and Yankee Jim's, not one is now running. Of the three at Bath, but one has been running regularly.

Plumas County.

Quincy *National*, April 4th: From 12-mile Bar we have the following: The miners are all at work in their claims, have an abundance of water, and are in expectation of big results when they clean up. The Never Sweat Co. made a partial clean up last week, and took out \$1,320—the result of 30 days' work for three men. This is the only company that has done any cleaning up since the water season commenced, but all expect as good if not better pay when they do.

The following items are from Indian Valley: A. F. Blood has bought the quartz

mill and ledge of Light & Bro., in Genesee Valley. The Whitney mill has not been doing very well of late, though working good rock. Last week they prospected their tailings, and panned out 17 ounces of amalgam in a short time. Aschheim has 300 tons of rock at the Lone Star mill, ready for crushing as soon as he can get his new moriar in and ready for use. The rock is from the Trucks and Waterworth ledge, and prospects well.

Sacramento County.

The mines in this vicinity are yielding well, and we are informed that more dust is purchased at this time in town, than has been the case for three or four years past.

San Diego County.

The San Diego correspondent of the *Times* of this city, says: A gentleman from the Escendido Gold mine, in this county, recently informed me that they had struck it "rich" in that mine at last, and that they are taking out large quantities of ore that average \$50 per ton. As they are below the level of the water, they have some trouble in keeping it out; but, with an additional pump, which is now being put up, they expect to overcome this without much difficulty.

I also learn that a very fine ledge, seven feet in width, has been found recently in the Los Encinates Copper mine, which averages 25 per cent. pure copper, as per assays made of the ore in your city.

Santa Clara County.

It is reported, says the Santa Cruz *Sentinel*, that a man living in Watsonville, has made a discovery of gold in or on the margin of Pajaro Valley, paying \$15 to the pan.

Shasta County.

Courier, April 11th: Mr. Neff, a resident of this county, has been prospecting during the last winter on the head waters of Cottonwood. He informs us that he found gold in paying quantities on several bars near the head of the middle fork of Cottonwood, and in one gulch he panned out an average of \$3 per day. He states that the country at the head of Cottonwood was never prospected to any extent, but undoubtedly contains good placer mines. He intends to return in May, with a complete mining outfit, and will proceed to thoroughly test the richness of the mines he has discovered.

McPeberson & Co. have completed their flume at Piety Hill, and commenced sluicing operations. The flume is 400 yards in length. Three hydraulic pipes are kept in operation day and night. This claim is the most extensive as well as the most promising placer mine in the county.

The Johnson copper claim on Little Cow Creek, prospects very rich, and promises to be a valuable property when more fully developed. The main lode is about five feet wide, and the rock yields from 80 to 95 per cent. copper. The Pryor brothers are directing the work on this claim.

The Batchelder brothers have not despaired of the ultimate success of the South Fork mines, and purpose commencing work on some of their claims at an early day. Parties from Chicago, Illinois, who possess abundant capital, are expected to arrive in a few days, for the purpose of examining ledges with a view to purchase.

Sierra County.

Downsville *Messenger*, April 11th: The French claim on Barnes' Ravine, near Howland Flat, is paying from \$8 to \$10 per day to the man.

Orleans claim, on Little Grizzly, is said to have been paying at the rate of 350 ounces per week, for some time, working 16 men.

Monumental claim, the tunnel which caved last fall, has a new tunnel in to the old breastings, and will soon commence taking out pay.

The Fashion claim, at Montrose Hill, is paying well.

The Sawpit Flat correspondent gives the following items: The Buckeye Co. is working 18 men, and getting from \$16 to \$18 per day to the hand. They have water to wash their drift dirt daily.

The New York Co. is working 18 men, and have their yard full of wash gravel. They expect to realize a large amount of gold when water makes its appearance to wash the same.

The Union Co. is taking out dirt as rich as usual.

The Franklin Co. is laid up for want of ground, their claims being worked out.

The Eagle Co. is working 16 men, and are getting out pay grit very fast, and prospects are flattering as they advance into the hill.

The Mountaineer Co., at Weldon Ravine, is working day and night in driving their tunnel towards their supposed to be rich channel of gravel deposits. They are now in 840 feet with their tunnel, and may strike

gravel any day, to gladden the hearts of the owners.

The Union Co. at Washington Hill, on the opposite side, is sinking an incline with four men, and taking out good pay as they go along.

The American Co., adjoining the Union and the Mountaineer companies, is running gangways, and working at present 12 men, taking out dirt averaging one ounce per man, a day.

TULUAME COUNTY.

Southern Democrat, April 11th: The mill on the Grizzly mine has been for some time past, and is now running, but has not cleaned up yet. We hear that the vein looks remarkably well, and that splendid rock is being taken out.

The miners of Sawmill Flat are now getting fairly to work after the severe winter. Wheels and pumps are running without intermission, keeping the deep claims dry. Last week, Goodrich & Co. found a piece of nearly pure gold, there being not more than an ounce of rock in it, which weighed 36 ounces. Their claim is known as the old Dow claim.

There has been quite an excitement created in the lower part of the county by the discovery of some very rich diggings on Big Creek, about two miles from Ballard's. They are said to pay \$25 to the pan.

The deep claims on Brown's Flat escaped the floods of winter remarkably well. Only one got filled with gravel. All the others were filled with water, but have been pumped out some time ago, and the miners are busy making up for lost time.

DACOTAH.

A correspondent of the Virginia Tresspass of March 30th, speaking of the extent of the Sweetwater mines says: The mines hereabouts are not confined to the eastern slope of the Rocky Mountains, but extend as far west as Green River. Pacific district is bounded on the north by the summit of the Wind River Mountains, on the east by the summit proper of the Rocky Mountains, on the south by the old emigrant road, on the west by Green River and Granite Creek, and contains an area of nearly 500 miles. It includes Big and Little Sandys, the Upper Sweetwater (that is, the headwaters of that stream), Granite Creek, the lake north of the head of that stream, and the eastern bank of Green River, as far north as gold has yet been discovered. Indians report gold in the stream some distance above the north line of this district, in the vicinity of Fort Boonville, directly west of Fremont's Peak, and the chances are that as soon as the snow will permit there will be another stampede in that direction.

The Virginia Enterprise of April 8th, says of the Sweetwater mines: They are not formed of any extensive "wash" of either ancient or modern lakes or rivers, as in California, but by the gradual decomposition and crumbling away of veins of auriferous quartz. This decomposed quartz, with the gold which it originally contained, has been carried for a short distance down along the channels of such ravines as cross the gold-bearing veins and doubtless some rich deposits have been thus formed, but they will very soon be worked out. If the country proves of permanent value as a mining region it will be through its quartz veins.

Santa Fe Gazette, March 14th: The very latest "Golconda" is located about 50 miles west of Cheyenne. A few days since a teamster arrived at the latter place and exhibited a piece of solid gold which he claimed to have picked up at the locality designated. As soon as the specimen was seen a general uproar was started among the railroad hands, extending through every camp, and as the excitement spread, hundreds of men left farms, and shops, and all sorts of business to secure their fortune by picking up lumps of gold similar to the one exhibited by the teamster.

IDAHO.

Owyhee Avalanche, April 4th: Deeds have passed between the parties owning the Ida Elmore and Golden Chariot mines, the boundaries of the respective mines are definitely fixed, and all trouble in the future avoided.

The Celestials at Boonville and vicinity are repairing sluice-boxes, ditches, etc., and if the present weather continue, placer mining will commence in good earnest in a few days.

Contracts are being let for sinking shafts, etc., on the Poorman. The ore is much richer in gold than formerly; the bullion being worth about \$5 per oz. There will be big money taken from the mine this summer.

Boise World, March 25th: Active mining has been resumed for the season all about here, up and along More and Elk creeks, and in a few days, we expect the mining season will be reopened in every camp in

the Basin. Parties owning claims in Deadwood Basin will start thence from here in a few days.

Judge Vance, of Pioneer City, informs us that on Monday next the ditches of Ben. Willson & Co., about that mining region, will be opened for the season, and in about a week more mining will be generally resumed throughout that and the adjoining camps.

A correspondent of the Montana Post of March 28th, writing from the Salmon mines, says: The gold of this basin assays about \$18.75 to the ounce. The claims that are being worked range from \$5 to \$25 per day to the hand. Those that have already been tested have invariably produced these results. The country has been poorly prospected; it may be said to remain as yet in its original condition, there being none of the hills up to this time touched, and all the mining thus far having been confined to the beds of the streams and small gulches. The wages paid laborers last season, which will be paid this year was \$6 per diem in good gold dust. And I am credibly informed by a great number of claim holders whom I know to be in earnest, that a thousand men in addition to present population, can find speedy and profitable employment here during the coming season.

MONTANA.

Post, March 28th: From every indication a few more days of the present weather will set everything in the gulches alive with activity. The small gulches are contributing their floods to the main gulch, and both above and below Virginia, sluices are being set, and everything placed in readiness for the mining season. Gentlemen from the surrounding gulches report the same state of affairs. In Ramshorn gulch, three or four companies are already vigorously at work.

A company has been organized in this place called "The Mill Creek Temperance and Furnace Association." Each member is to ascertain the average amount heretofore expended per week for liquors, and this amount each week is to be put into a pool for the development and reduction of leads at the creek.

We noticed yesterday at Hussey & Dahler's a 60-oz. brick from Alameda rock, assayed by S. F. Molitor, Helena, and stamped \$228.69 coin. About three-fourths of the value is in gold. It was crushed from four tons of rock in Mitchell's arastra, and is a yield of about \$75 currency per ton.

The I. X. L. and Sensesdorfer mills cleaned up Monday last bullion to the amount of over \$11,000, coin value. The I. X. L. had 310.19 ozs., valued at \$5,673.88 in gold, or \$7,886.66 in currency. We did not learn the number of ounces returned by the other mill, but the coin value of the bar was a fraction less than that of the former, it being \$5,660.54.

The National Bank received from Phillipsburg, last week, 454 lbs. of silver bullion—the result of the late period of activity of the St. Louis & Montana Co's mill. The mill has shut down again for want of quartz.

Mr. Fred. Cope, who has just returned from a trip through Gallatin Valley and the Crow Creek mines informs us that there are from half to ounce diggings. Work will be generally commenced in the mines in a few days, and from all indications it will be one of, if not the largest, gold producing camp in the Territory this season.

NEVADA.

Humboldt.

Unionville Register, April 4th: The Dnn Glen correspondent writes: The Essex mill, one mile from town, is now completed. It commenced crushing rock to-day from the Essex and Empire mines. This is 10-stamp mill, of 40-horse power, and is prepared for using sage-brush fuel, it being preferred to wood. Six Varney pans are used, and three large separators. It has 10 pulp tanks, with ample accommodations for settling the pulp. The facility for supplying all parts of the mill with water is most complete, and all the machinery of the mill is perfect. The mill has been erected in a thorough workmanlike manner under the supervision of Mr. G. W. Holt, the Supt.

In company with E. J. Elzy, the Supt., I paid a visit to the Monroe mine. I beheld sights there, in the shape of rich looking gold quartz, that would not only delight but astonish the beholder. The main tunnel is 165 ft. in length, and a contract has been let to continue it to 300 ft., where it will intersect the ledge in the main shaft, at 150 ft. from the surface. The ledge there is 2½ ft. in width and of a rich character; free gold can be seen all the way through it. The ledge increases in richness with its depth, and gives every evidence of being one of the richest gold bearing quartz ledges in the State. A drift of 205 ft. has been run

south on the ledge in the main shaft, and the ore found to be of the first quality and superior to any before found. There are about 200 tons of rock lying on the dump, which is expected to pay \$200 to the ton. This rock will be sent to the Essex mill for reduction in a few days.

Seven men are now at work on the mine, but more will be put on in a short time.

The Humboldt River G. & S. M. Co., owners of the Monroe mine, will erect a steam mill in this place as soon as possible, the machinery having been shipped from New York, and a portion of it has already arrived.

Shipped, from Fall's Pioneer mill this week, 900 ozs. of bullion; value, \$1,080.

Esmeralda.

The Pine Grove correspondent of the Virginia Enterprise, writes April 15th, as follows: Our mines, that is the paying ones, never looked better.

The Wilson mine has a very fine body of ore exposed in the upper tunnel—which is being extracted at the rate of from 15 to 20 tons a day. In the lower tunnel a large vein of sulphuret ore rich in free gold was some time ago disclosed, one hundred tons of which yielded within a few cents of \$40 per ton. Mr. Wilson is now having a new tunnel run, a regular short cut from the main tunnel to this body of ore which lies at the end of the tunnel, the course of which is shaped like a fish hook.

Billy Bourne, the Supt. of the Midas mine, is now busily engaged in getting out another run of almost 205 tons from that mine. No work has been performed on the Wheeler mine since the last run of 600 tons, on account of a disagreement of the owners. The Poorman Co. are busily engaged in running a new tunnel; they will strike the sulphuret rock on the ground of the Burlesque, and then follow the wall to the north end of the claim, and there cut their ledge at a depth of 100 ft. from the surface. Messrs. Blasdel and Goodrich have recently been prospecting their segregated interest in the Mountain View claim. They have a large body of low grade ore in the claim, out of which they can extract from 15 to 20 tons daily, that will pay from \$12 to \$20 per ton. Satisfactory arrangements having been made with the Pioneer mill for the reduction of the ore from this mine, work will be immediately commenced thereon. Mr. Whallon is working the Hamilton Co's mine with an excellent show of success.

The El Dorado Co. have recently run a tunnel into their claim, about 200 ft., and contemplate continuing the work 100 or 200 ft. further. Some very fine sulphuret ore, in small veins, has been cut through. The Pioneer mill has been engaged in reducing some of the refuse ore from the Wheeler, which paid nearly \$18 per ton, and will soon commence on a run from the Midas.

Crosman's arastras are running night and day on rock from Toombs & Abraham. From five to eight tons per day are worked. Toombs & Abraham's new mill will be in working order in a couple of weeks, and will be used exclusively on their own ore. The Washington district, about which there was so much stir last summer, has "petered," i. e. the ores have proven so refractory that nearly everybody has left it, and are now recognized as denizens of this place.

Reese River.

Reese River Reveille, April 7th: J. R. Murphy received at the assay office of the Keystone mill, for the week ending the 6th inst., 23,445 ozs. of crude bullion for melting and assaying.

April 8th: Yesterday, six bars of bullion, from the Knickerbocker mill, near Ione, were brought into this city.

Last night the stage brought four bars of bullion from the mill of the Combination Co.

To-day a wagon carried from Elder's lumber yard five Wheeler & Randall's improved millers, each weighing 1,450 lbs., and a retort for the mill of the Twin River Co. at Ophir Cañon.

The Keystone mill at Austin, was destroyed by fire on the 6th inst.

April 9th: Samples of ore from the Hidden Treasure lode in White Pine district, which were brought to this city, and assayed in different offices, ranged from \$675 to \$1,700 and \$2,300 per ton. The lode is undoubtedly the best in the district.

The mill of the Smoky Valley Co. in Geneva Cañon is about ready for crushing. The mill is arranged for crushing the ore wet, and the result of the experiment of treating it without roasting will be looked for with interest. The ore to be reduced was obtained from the company's claim on the great Smoky Valley lode, of which there is said to be a large amount on the dump ready for the mill.

The Belmont stage yesterday brought into the city two bars of bullion from the mill of the Belmont Co.

Belmont Reporter, April 4th: The mill of the Belmont Co. which has been lying idle for a time, is again in motion. It is the intention of this company, as soon as the weather becomes settled, to erect at their mill one of the Stetefeldt furnaces, or a sufficient number of reverberatory furnaces for roasting their ore, at which time the necessary alterations will be made in the batteries to admit of the dry crushing process.

Paxton & Co., during the past month shipped from here 65,065 ozs. of refined bullion, all from the mill of the Combination Co.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late raining news from this district.]

Virginia Enterprise, April 7th: We are informed that 3,600 ounces of crude bullion from the Lady Bryan mine, were yesterday molded into bricks at the Gold Hill assay office. It made, when melted, three large bricks, the value of which is but a trifle short of \$5,800, showing the yield of the ore to be in the neighborhood of \$29 per ton.

The Ophir Co. started up their pump at the new shaft on Saturday morning last. The bore of the pump is 12 inches in diameter, and the whole of the machinery works to perfection. The shaft is now down about 130 feet, and is filled with water to the height of 35 feet. Working at the present rate of speed, the shaft will be drained in about five days, when sinking will be resumed. The new shaft is just in range with the rich deposits found in the Savage, and Hale & Norcross mines.

April 8th: There was shipped from Wells, Fargo & Co's Gold Hill office, on the 5th, 6th and 7th of this month, 39 bars of bullion, weighing 2,572 pounds, and of the assayed value of \$108,571.99.

April 9th: Good ore and an abundance of it, is being taken out from the winze in the lower level of the Crown Point mine.

April 10th: The Yellow Jacket Co. are taking out about 150 tons of ore per day at their north shaft. At the south shaft they are drifting for the ledge in their lower level with one set of men, while another is engaged in sinking the shaft to a still greater depth.

The shaft of the Bullion mine is now the deepest in the State, and the deepest but one on the Pacific coast—being 1,200 feet deep. At this depth the company have commenced drifting for the ledge, which lies to the eastward of the bottom of their shaft, at a distance, it is estimated, of 45 feet. Although their drift is in but a few feet, they are already getting into favorable looking quartz. At this great depth they are much less troubled with water than at points above.

April 11th: The total shipment of bullion from this city and Gold Hill, during the past week, was 7,900 pounds, worth \$218,159.26.

A party of men are at work upon a piece of ground leased from the Chollar-Potosi Co., and are taking out considerable quantities of paying ore. The ore is hoisted through the old Milton shaft.

NEW MEXICO.

Santa Fe Gazette, March 7th: A company called the "San Antonio River, Placer Mining and Ditch Co.," intend to build a ditch, commencing in the vicinity of Plaza Rotta. Said ditch will be from five to eight miles in length, and is intended to furnish water for, and to cover the placer diggings formerly discovered and more recently prospected at and near Plaza Rotta, Arroyo Hondo and along the foothills and flats bordering on the base of what is generally known as the Taos Mountain; a range lying westward of a certain mountain known as the Pueblo Mountain, some six miles from Taos.

The company are now making arrangements for a preliminary survey for said ditch, with the intention to prosecute the work without delay, and carry water sufficient for both placer and hydraulic washings; the full extent of which are not yet known, but have been sufficiently prospected to justify the enterprise.

Some 50 to 70 miners are now upon the ground prospecting and making further discoveries.

OREGON.

Virginia Tresspass, April 11th: Superintendent C. C. Thomas, showed us yesterday a sample of gold in a form we never before had seen it. The specimen was a knot of gold wire, evidently nearly pure, the mass weighing nearly half an ounce. It was from a quartz vein in Oregon, and was presented to Mr. Thomas by a friend just down from among the webfeet.

Mining and Scientific Press.

W. B. EWER, SENIOR EDITOR.

agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling
agent for this paper. July 15, 1867.

San Francisco:

Saturday Morning, April 18, 1868.

Notices to Correspondents.

STAR-GAZER.—As you suggest, it is quite
probable that as astrology, in the earlier
ages of science was almost invariably
connected, in the same person, with the
study of alchemy,—or the black art, as its
root indicates,—the adoption of metallic
symbols identical with those applied to
represent the heavenly orbs then known,
and now ascertained to belong to our
solar system, was more immediately
connected with astrology than mythology.
In this surmise it is quite probable that
our correspondent is right. We opine,
however, that the titles pertaining to the
chief deities connected with Grecian
mythological Pantheism, were applied to
our satellite, and the five visible planets
which, like our own sphere, periodically
perform their revolutions around the
grand central orb, the sun, prior even to
the study of alchemy. We do not, there-
fore, think we have been very far wrong
in making the allusion we did, in suggest-
ing a mythological origin to alchemical
metallic symbols.

CELT.—The use of tests for the discovery of
certain substances held in aqueous and
other solutions, was first particularly
dwelt upon by Boyle, who was occasion-
ally fortunate in their contrivance and ap-
plication. He observed the conversion of
certain vegetable blues to red by the
agency of acids, and to green by alkalies,
the cloudiness produced by common salt
in silver solutions, and their discoloration
by liver of sulphur or alkaline sulphide.
Boyle was born January, 1627, at Lismore
Castle, County of Waterford, Ireland,
and, in 1680, was elected President of the
Royal Society, and died on the 30th De-
cember, 1691. The celebrated Dr. Bur-
nett preached his funeral sermon, "in
which," says Evelyn, "he spoke of his
wonderful civility to strangers; the great
good which he did by his experience in
medicine and chemistry; the works, both
pious and useful, which he published;
the exact life he led, and the happy end
he made." Boyle was one of our most
important scientific pioneers.

S. M. Shasta.—What are termed the noble
metals comprise platinum, gold, silver
and mercury, and are so termed and were
originally so denominated, less on ac-
count of their intrinsic value or great
specific gravity, although the former
property, and possibly the latter, has had
some influence in fixing the term which
was originally applied by the alchemists.
The application of the term originally
arose from the circumstance that it was
found that the only oxides of metals that
became reduced to the metallic form by
the simple employment of heat, were the
oxides of the metals named; none others
are so reduced, in consequence of which
the terms "calx" or "caput mortuum"
were employed to denote such. Rivot's
proposed improved furnace is based on
this property.

BLOW-PIPE.—You failed in obtaining a
qualitative analysis, probably because
you used too large a proportion of soda.
Some minerals combine readily with very
small portions of soda, but with difficulty
if more be added, and become absolutely
insoluble if in considerable excess. If
the substance to be assayed is void of any
mineral possessing an affinity for the flux,
soda will be useless, as no combination
will take place, in which case the soda
will become absorbed by the charcoal-
holder if this material is employed for
that office.

Chlorination of Silver Ores.

After several months' careful experiments
on different silver and other argentiferous
ores of a notably rebellious character,
Messrs. Kustel and Hoffmann, of this city,
have succeeded in extracting, separately,
copper, gold and silver, up to a high per-
centage, and in a very economical way;
roasting, however, is indispensable.

The advantages of this new process, or
rather of the new combination and applica-
tion of known and approved methods of
working silver ores consist—

1. In dispensing with the use of quicksil-
ver,—of which, by the ordinary pan pro-
cess, from one to one and one-half pound
for each ton of ore is lost; amounting thus
to from 6,000 to 10,000 pounds a year, in a
mill operating on about twenty tons per
day,—besides the liability to salivation by
accidents in retorting.

2. In dispensing with the power now re-
quired for amalgamation and grinding in pans;
each of which, capable of treating three
tons of ore in twenty-four hours, requires
from five to six horse power, and moreover,
consumes steam for heating the pulp. The
pans are superfluous in the chlorination
process, their place being supplied by
wooden tubs of four to ten tons capacity.
It is well known in Nevada and the mining
Territories, that when roasted ore is amal-
gamated in iron pans, their sides are de-
stroyed by the chlorides in from nine to
twelve months;—an important fact, when
we consider the heavy freight, and the cost
in case the pans have to be replaced by new
ones or by new parts. Another objection
to the use of pans, is the fact that base
metal ore cannot be properly treated in
them,—giving bullion of low grade on ac-
count of the iron by which the amalgam is
overcharged. A similar ore, treated by the
chlorination process, yields from eighty-
five to ninety per cent. of silver, always
above 800 fine.

3. Another great advantage is the facil-
ity with which roasting may be performed.
In all processes which are founded on the
formation of chloride of silver in the ore,
the result depends entirely on the proper
roasting; and the performance of this op-
eration is so much the more difficult, the
more base metals and the less sulphur the
ore contains. Unless, for instance, Patena
had modified the roasting, as he did, he
could not have made use of Percy's and
Hanch's suggestions, to extract the silver
by dissolving its chloride by bysulfate of
soda. But Patena's process is objec-
tionable in this country, for the very reason
of the expensive and tiresome roasting. For
the chlorination treatment, a simple prelim-
inary roasting, with a good finishing heat,
is all that is required to secure a satisfac-
tory result.

One of two lots of the "Rising Star"
silver ore, Owyhee, containing \$298 in sil-
ver, per ton, besides some gold, worked by
the chlorination process, by order of Mr.
Leut and H. Janin, and roasted with four
per cent. of salt, gave, besides gold and cop-
per, 96.9 per cent. of the silver,—the bull-
ion being 856 fine. The other lot, roasted
with one per cent. of salt, yielded 88 per
cent.,—880 fine.

A small lot of concentrated ore, contain-
ing a great deal of zinc blende, from the
Tarshish mine at Monitor, Alpine County,
which was received from Mr. Graff, the Su-
perintendent of the above mine, gave also
88 per cent. of silver; a result, which, con-
sidering the richness of the ore,—\$1,608
in silver per ton, besides a considerable
amount of gold,—is certainly gratifying.

From pan-tailings of different rich spec-
imens from Reese River, worked in San
Francisco, by chlorination without roasting,
93 per cent. was obtained. A description
of the process will be given in our next
issue. Messrs. Kustel and Hoffman filed a
caveat for this improved mode of working
gold and silver ores, some time since, and
have more recently made applications
through this agency, for letters patent.

The Microscope in Geology.

Within the last thirty-five years, the
compound microscope has, we may almost
say, created the science of General Anatomy.
By this term is meant the study of the ele-
ments which serve as the material of which
the various organs of the body are built
up;—in other words, the geology,—as Prof.
Holmes calls it,—of the body. Without
this instrument, such a science would have
been impossible. The most careful dissec-
tion had previously failed to demonstrate,
with any degree of certainty, many points
of minute anatomy which with its aid be-
came clear. The structure of bone was al-
most wholly unknown. The composition of
nerve matter, and the nature of several of
the tissues, were a sealed book. Although
the value of the instrument in the hands of
the naturalist had begun to be recognized,—
since Ehrenberg and others had by its
means demonstrated the existence and struc-
ture of organisms so minute that five hun-
dred millions of them may and do exist in a
single drop of water,—nevertheless its prob-
able use to the anatomist and physiologist,
was doubted. John Bell, a justly cele-
brated authority of the times, sneered at
the idea;—saying that the microscopists
"saw just in proportion to the glasses they
used, or to their skill in the art, now almost
forsaken." Others laughed at the fanciful
notion of "discovering the properties of
tissue in its form." But the tune is now
changed;—Physiology has gained as much
from the use of the microscope, as has An-
atomy; and complex organs, the operation
of which was doubtful while the details of
their structure remained unknown, are no
longer puzzles to the scientist.

We have chosen this manner of introduc-
ing our subject,—"The Microscope in Ge-
ology,"—because 1st, it is comparatively a
novel one;—and 2d, because its introducers
met with sneers like the physiologists who
proposed to "discover the properties of
tissue in its form." "Mountains,"—say
the laughers,—"should not be looked at
through microscopes." It would appear,
from the researches of Mr. Sorby, that the
microscope is destined to prove of as great
value in geology and lithology, as in the
sciences aforesaid. It is believed by those
who are following up the subject, that by
its aid in the minute examination of the
structure of a rock, and the arrangement of
its various components, its origin may be
determined. The bearing of this upon
questions concerning the geological forma-
tion of this or that region, will be seen to
be important.

We have recently read a most interesting
paper upon this subject, by David Forbes,
F. R. S. This gentleman has been engaged
for several years in this direction; and has
a collection of rock and mineral specimens,
prepared for this kind of examination, which
is unsurpassed. It is necessary that the
specimen should be ground down to such
thinness as to transmit light. This is, say,
from the one-hundredth to the one-thou-
sandth of an inch;—according to the trans-
parency of the constituents of the rock.
The grinding is commenced upon an iron
plate, with emery of different degrees of
fineness in succession, and finished upon a
slab of fine-grained marble, with water
alone. This surface is then cemented with
Canada balsam to a bit of plate-glass, which
serves as a handle while the other side is
ground in the same manner as the first.
When finished, the specimen is removed
from the plate-glass, and mounted on a
slide for the microscope.

Most rocks, if arranged according to
their structure, fall naturally into two
classes,—primary and secondary. These
terms are here used without reference to the
chronological order of the rocks. The
primary or eruptive rocks have certain
structural peculiarities which distinguish
them, under the microscope, from all
others,—whatever may be their age, or

wherever they may come from. In such
rocks, the mineral constituents are crystals,
more or less perfect, and disposed at all an-
gles to each other,—showing that the mass
was at one time in a state of fluidity,—
either aqueous or igneous,—and that the
particles had consequently perfect freedom
of motion. In all rocks of this class,
whether lavas, trachytes, syenites, or gran-
ites,—whether hard or soft, compact or in
the form of ashes,—a similar structure is
found. By the examination of a specimen
prepared as above described, those of its
mineral constituents which were formed at
the time of the solidification of the rock,
may be distinguished from such as are
the products of subsequent alteration.
When,—as is the case with translucent, col-
orless minerals, such as quartz, leucite, cal-
cite, etc.,—the appearance is nearly the
same, they may be distinguished by their
different optical characters, with the aid of
polarized light. Some other points are de-
termined by the same means. Even after
changes have been produced in primary
rocks by the action of water and other agen-
cies, they can be distinguished, under the
microscope, by the persistence of the least
decomposable portions,—the softer parts in
the interstices having disappeared.

Among the secondary, or sedimentary
rocks, are included those which are formed
of the immediate products of the breaking-
up of the primary rocks. These being
identical in chemical and mineralogical com-
position with the original rock, are often
undistinguishable from it, except by the
aid of the microscope. This instrument
shows the internal structure of the two to
be totally different; revealing the fact, that
while in the primary rock the crystals are
perfect, in the secondary they are broken
up, and moreover differently arranged. In
the same way, roofing-slate is plainly shown
to owe its cleavage to the lines of weakness
produced by pressure, upon sedimentary
beds, of a force applied perpendicularly
to their plane; that force having caused a
flattening of some of the particles, and a
sliding upon each other, of others. By the
microscope Mr. Sorby has shown not only
that limestones had no original crystalline
structure, but that they are made up of the
ruins of organisms the forms of which can
often be recognized and determined.

In altered or metamorphic rocks, pro-
duced by the induration of sedimentary
beds at the points where they are cut through
by eruptive dykes, the perfectly hard rock,
with conchoidal fracture, is shown by the
microscope to be chemically and mineral-
ogically identical with that of the original
beds,—less the water which those beds con-
tained. The chemical changes which some-
times result from infiltration, are often
demonstrable by the same means. Mr.
Sorby showed that certain beds of iron-
stone were originally shell limestones con-
verted into carbonate of iron by the action
of ferruginous solutions; fragments of the
original shells being distinctly traceable in
all stages of conversion. So of other beds
which have been similarly changed by the
action of magnesian solutions. The mi-
croscopic examination of quartzite and foli-
ated schists, shows them to be of sedimen-
tary origin; the outlines of the original
sand grains, and the signs of ripple-drift
being plainly traceable.

Mr. Sorby's discovery of the fluid cavities
in the quartz of granite, is considered to
prove that the rock solidified under a pres-
sure which caused it to entangle and retain
watery vapor. He found these cavities also
in the quartz of volcanic rocks, and in feld-
spar thrown from the crater of Vesuvius;
and infers thence that both quartz trachytes
and the oldest granite were formed by sim-
ilar agencies,—classing them together as
igneous or eruptive rocks.

The use of the microscope in the direc-
tion thus briefly noticed, is, Mr. Forbes
says, still in its infancy. Except Mr.
Sorby's papers upon the subject, nothing

has been given to the public. It is to be hoped that these investigations will be pursued with as much enthusiasm as those to which we alluded in the commencement of this article; and that it may not be long before our acquaintance with the "anatomy of the earth" shall be as complete as our acquaintance with the "geology of the body."

WOOD HANGINGS.—We have received from our traveling partner, Mr. Dewey, several samples of wood hangings, a new substitute for paper hangings, which has recently been introduced to the public in New York. This new article of manufacture has already been quite fully noticed in our columns. The samples before us are not thicker than common wall paper, and are taken off as smooth as the finest shaving. They are furnished in rolls, like paper, twenty-four feet long and eighteen inches wide. The prices of common woods are fifty cents per roll; finer woods, like mahogany, bird's-eye maple, etc., seventy-five cents; rosewood, satinwood, etc., at from \$1 to \$2 per roll. It is evident that these wood hangings must greatly exceed in durability and elegance of finish all the old methods of decorating walls and ceilings. We presume that early arrangements will be made to introduce them into this city.

THE STATE GEOLOGICAL SURVEY.—"El Dorado" writes us upon this subject. He pertinently says: "Now the question arises with all who have the future interests of the State at heart,—shall we let the matter so rest? Shall we as a live progressive people allow the acquisition of valuable knowledge to be thus strangled, and the work of years thrown to the winds? Cannot there be a sufficient expression of public opinion to warrant the Governor in pledging the credit of the State to save and put together what has already been done?"

The communication closes thus: "We charge no blame upon Prof. Whitney, but believe him eminently calculated to do the work that was intrusted to him. His only error was the not catering to the wishes of the public, by publishing practical knowledge of it was developed. That object should be mainly kept in view by any future Geological Survey."

NEW STATE ASSAYER.—Louis Falkenau, of the firm of Falkenau & Hanks, Pacific Chemical Works, has been appointed State Assayer by Governor Haight. This gentleman is especially fitted for the position. As regards competency and reliability, perhaps no man in the State could have been selected who would come more nearly up to the mark.

HENDY'S LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

Directions for Operating Hendy's Concentrators:

- The sulphurets are drawn off while the Concentrator is in motion, in the following manner:
FIRST—In setting up, set the pan, A, level by the inner rim, near its center.
SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL. (8 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (8 Concentrators).....	Grass Valley, Nevada County.
NORRIDGEWOCK MILL. (2 Concentrators).....	Grass Valley, Nevada County.
VALENTINE & CO., Commercial Mill (3 Concentrators).....	Nevada County.
HUMBOLDT CANAL CO. (1 Concentrator).....	Humboldt County, Nevada.
ROBINSON & McALLISTER M. & M. CO. (3 Concentrators).....	Hunter's Valley, Mariposa County.
PLYMOUTH ROCK MILL CO. (2 Concentrators).....	Calaveras County.
MIDAS MILL CO. (4 Concentrators).....	Virginia, Montana.
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....	Virginia City, Nevada.
VULTURE CO. (8 Concentrators).....	Prescott, Arizona.
NOYES & CO'S MILL. (2 Concentrators).....	Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....	Owyhee District, Idaho.
MOREY & SPERRY (1 Concentrator).....	New York.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Sinaloa, Mexico.
EL TASTE CO. (2 Concentrators).....	Sonora, Mexico.
B. F. BROWN (1 Concentrator).....	Melbourne, Australia.
JAMES HENTY & CO. (1 Concentrator).....	Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.

J. HENDY, Esq.—*Dear Sir:*—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

NORTH STAR MINE, Grass Valley, Feb. 26, 1868.

J. HENDY, Esq.—*Dear Sir:*—In answer to your request, I give my opinion in regard to the eight Concentrators we have at work. We have had one at work on blanket washings for the past three months, and it has proved highly satisfactory in saving sulphurets and amalgam, that in past years we have been losing. Of the other seven, six are taking the pulp from the batteries, and the remaining one concentrating from the six, which, when thus reconcentrated, yield 95 per cent. of pure sulphurets. Respectfully, etc.

W. H. RODDA, Supt.

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. Co.,
VIRGINIA CITY, Nev., Sept. 17, 1867.

JOSHUA HENDY, Esq., San Francisco:—*Dear Sir:*—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours, very truly,

LOUIS JANIN, Jr.

The bill was presented in accordance with the above request, and duly paid.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes effort for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco.

Flue or Tubular Boilers, with plain, circular or spiral
courses. Upright Flue or Tubular Boilers, Locomotive and
and Marine Boilers, and Wrought Iron Tanks of every de-
scription.
Hydraulic Pipe supplied at reasonable rates. In or-
dering, give the quantity of water to be supplied, height of
the fall, and total length of pipe, so as to enable the firm to
determine the diameter of the pipe and thickness of iron to
be used.Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in re-
pair with promptness.To Boiler Makers and Machinists in the In-
terior.—The firm is prepared to furnish estimates of
Boilers, supply new heads, drilled and punched, and attend
to the selection and forwarding of Iron for Boilers, Pipes
and other purposes.Plans, Drawings and Specifications.—The firm
is prepared to make out Plans and Specifications, receive
estimates, and superintend the Erection of any Machinery
that may be entrusted to their care.To Inventors.—The firm is prepared to assist in de-
veloping the plans of those who have the ideas, but not the
practical experience necessary to put the same in form, by
making Drawings of their inventions, giving them the ben-
efit of their practical knowledge in the construction of Ma-
chinery, and attending to the manufacture and introduc-
tion of their inventions.

LINING FOR SHAFTS.—The following is from a recent lecture at the Royal School of Mines, by Mr. Warrington Smyth: "Al- though the expense of lining shafts with masonry was very great, that was an exped- ient which sometimes had to be resorted to. In certain positions, and under pecu- liar circumstances, timber was subject to dry-rot; and there were instances in which levels had to be timbered twice over in four or five months. Frequently this rapid rot- ting was found to result from unsatisfactory ventilation. Timber, if kept cool, and at the same time moist, would last a long time; cases were known in which it had remained sound for centuries; but bad ventilation changed those conditions, and the air be- came hot and dry, and the timber would go rapidly. Supposing they had a level in which the air was circulating freely through it, with at one point a winze covered with a trap-door, it would be found that while the timber would stand well in the level in the good atmosphere, when the trap-door was lifted the winze would be full of hot, confined air, the wood covered with fungi, and the process of rotting going on, not only upon wood, but even the iron. Thus, in going over a mine, the visitor ought to be excessively cautious whenever he made a sudden plunge, as it were, into hot and confined air, as in such cases the staves of ladders, whether of wood or iron, were apt to be rotten to the core. The various pas- sages and entrances to a mine were so elab- orate and complicated that examples of every kind were to be found; and there were also a great variety of means used for the preservation of timber, some of which were not very consistent with that rigid economy which the mining manager ought always to observe. Thus in salt mines it had been observed that the timber lasted longer than usual, and in consequence it had been proposed to soak timber in a strong brine. Again, it was the practice in many mines instead of removing timber found in a state of decay to replace only a sufficient proportion to secure the opening, leaving the rest to complete the process of rotting, and to fall in the end when they could stand no longer; but it had been found that the removal of decaying matter was of great importance, for rot was, in fact, contagious, and spread with rapidity. In some shafts water was allowed to flow down when the lining was of wood, so as to keep it perpetually moist. Again, another method mentioned as successful was that of soaking the timber in pools of the water pumped up out of the mine into which the timber was going, and, no doubt, when such waters were impregnated with some of the sulphates they might aid in the preser- vation of the timber."

EXACT TIME-KEEPERS.—ALMOST.—The new observatory at Neuchâtel, in Switzer- land, has rendered good service to chro- nometer makers by enabling them to regu- late their watches with more exactness. Prizes are now given to those makers whose watches approach nearest to perfection. A marine chronometer lately tested for two months gave 0.164 of a second as the mean variation from day to day. The improve- ment in common watches during five years will be seen by the following table of mean variations in 24 hours:

In 1852 the mean variation was.....	1.64 sec.
In 1853 the mean variation was.....	1.28 sec.
In 1854 the mean variation was.....	1.27 sec.
In 1855 the mean variation was.....	0.88 sec.
In 1856 the mean variation was.....	0.74 sec.

More than three-quarters of the chronom- eters observed in 1856 gave a mean varia- tion per day of less than half a second.

A ROYAL MUMMY.—Some 18 months since, the skeleton of one of the Pharaohs was deposited in the British Museum. The lid of the coffin containing it was inscribed with the name "Pharaoh Mykerimus," who succeeded the heir of the builder of the great pyramid about twenty centuries before Christ. The monarch whose crum- bling bones and leathery integuments are now exciting the wonder of numerous gaz- ers in London, reigned in Europe before Abraham was born,—and only about two centuries or so after Mizraim, the grandson of old father Noah, and the first of the Pharaohs, had been gathered to his fathers.

FOR ETCHING OR WRITING ON GLASS.—A writer in Dingler's *Polytechnisches Journal* recommends a solution of fluoride of am- monium, which can be used with an ordi- nary quill, and on drying leaves a distinct line.

the best photograph taken in a new, pleasant per-
manent business. Full particulars free by return mail, of
sample retelling at \$1.50 for \$50 cents. A. D. BOWMAN &
CO., No. 4 Broad Street, New York.
[Clip out and return this notice.] 18v16-3m

PAPER FOR BUILDING PURPOSES.—Panel work and slabs for the interior finish of houses is now made in New York city, of card fiber, the disintegration being effected by the aid of steam. This fiber is mixed with clay, resin, sizing, etc., and molded into slabs and panels, all ready for inside finish work.

The following advantages are claimed for this new building material: In a few hours all the walls and ceilings of a house can be put up by nailing them to the ordinary battens upon which the laths are nailed. The work can be done as well in winter as in summer time, and no drying is required. The fibrous slabs do not warp, crack, break, peel, shell, crumble, nor decay; and they keep out damp, heat and cold better than lath and plaster. They are somewhat similar, but asserted to be superior to, the panels or wainscoting found in many palaces and mansions in England. Their cost is said to be less than half the cost of common lath and plaster. It is proposed to make them fire-proof and water-proof, for the roofs and outer walls of houses. According to estimates which have been made, the cost of an ordinary cottage house will be very much less than the present cost of a frame house of the same size.

TELEGRAPHING IN AN EMERGENCY.—The Troy *Whig* of March 6th, has the following: The up-train over the Bennington and Rutland Railroad, on Monday ran into a deep snow-bank about three-fourths of a mile north of Shaftsbury. Mr. John M. Hills, telegraph operator of Burlington, happened to be on the train. A piece of wire having been procured, and the telegraph wire cut, Mr. Hills formed a circuit, and communicated to the officers of the road at Rutland their condition, asking that an engine be sent to their assistance,—which was at once dispatched. Mr. Hills received the answer from the Rutland office by placing the ends of the wire on either side of his tongue.

If the type of your evening paper appears indistinct, you will find a remedy in Muller's spectacles, No. 205 Montgomery street.

Wood & Mann's Portable Steam Engines, 6, 8, 10, 12 and 15 horse power,

With newly invented Water Bottom, which entirely surrounds the fire grate and ash-pit, forming underneath the ash-pit, as on the sides of the furnace, a three or four inch water space, by which additional heating surfaces are obtained, the accumulation of sediment around the fire-box or furnace is entirely prevented, and renders it perfectly safe to use near any barn, or in any farm-yard, or in any building where a stove would be allowed, as no sparks can possibly escape from the furnace or ash-pit. The sediment has a free passage to the bottom of the fire-box, and can be blown off daily by the blow-off cock underneath the ash-pit, by which means the boilers may be kept clean much longer than under the old system. The great saving in repairs which is effected by the use of these water bottoms, and the constantly increasing demand for them, prove their superiority to any others yet constructed.

MOSHEIMER'S

Pioneer Mining School,

ASSAY OFFICE

—AND—

Metallurgical Works,

SAN FRANCISCO.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

- 1.—Assaying of Ores, Metals, and other Mineral Substances.
- 2.—Metallurgy of Gold, Silver, Copper, Lead, etc., by Smelting, Amalgamating, Lixivation, etc.
- 3.—Gold Extraction, by Chlorine Gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.
- 4.—Concentration.—Dressing of Ores.
- 5.—Construction of Furnaces, in which any kind of fuel may be used for Smelting, Roasting, etc., as well as the erection of any Machinery or apparatus required in Metallurgy and Technology.
- 6.—Technology, or Chemistry as applied to any special branch of Manufacturing.

By my Practical Mode of Teaching, any person of ordinary ability can learn to assay Ores in three lessons, and the working of all the ordinary and refractory ores in a few weeks.

Gentlemen of almost every profession, who, within the last two years have graduated at my establishment, will bear testimony that from my instructions they have learned more in a few weeks than they ever expected to learn.

My charges are from \$50 to \$200.

Ores of every description assayed and worked

JOSEPH MOSHEIMER,

Pr. Chemist, Metallurgist, C. E., etc.

Office, 328 Montgomery street. Works, 2,005 Powell street. 3v16 3mcw

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin, the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

COOSE BAY COAL.

The Cleanest Burning and Most Economical Fuel on the Coast.

Sold by all dealers in this city and Oakland.

EDWARD FLANAGAN,

Agent Coose Bay Coal Company, 7v16-3m No. 606 Battery street, near Jackson, S. F.

To Capitalists.

FOR SALE—THE CONTROLLING INTEREST IN ONE of the best Gold and Silver Mines in the State of Nevada. The owners not having sufficient means to purchase the necessary machinery to work to advantage, will dispose of a portion of the mine at a bargain. Any one willing and able to embark in the enterprise, will be shown and probably convinced that it is no visionary scheme. The ledge will now pay more than the expense of working it, and is very rich, increasing in width at every foot in depth. For particulars apply at this office. 13v16-1m

Pacific Mail Steamship Co's
STEAMSHIPS FOR
NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND BRANNAN STREETS, AT 11 O'CLOCK A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from PANAMA for NEW YORK.

On the 6th, 14th, 22d and 30th of every month.
Steamer leaving San Francisco on the 6th touches at Manzanillo. All touch at Acapulco.
Departure of the 14th is expected to connect with the French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Through tickets can be obtained.

The following Steamships will be dispatched on dates as given below:

April 6th—GOLDEN AGE.....Capt. E. S. Farnsworth, Connecting with HENRY CHAUNCEY, Capt. Gray.
April 14th—SACRAMENTO.....Capt. Wm. B. Parker, Connecting with OCEAN QUEEN, Capt. Bradbury.
April 22d—MONTANA.....Capt. J. M. Cavalry, Connecting with RISING STAR, Capt. Conner.
April 30th—COLORADO.....Capt. W. E. Smith, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult. An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.
Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of \$10 to \$20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

The Steamship CHINA, Capt. Geo. F. Lane, will be dispatched April 14th, at 12 o'clock, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting at Yokohama with the steamer COSTA RICA for SHANGHAI.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, - - - \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Seidl.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. C. Felt.*

After a careful and thorough perusal of the same as it was in my power to do, I came to the conclusion that, for conciseness, correctness, and practicality of advice, as well as for completeness and simplicity of style, it was and would be, without a rival. I regard your work as the best of its kind. I know of but few such in any profession who would not be benefited by its careful study.—*Wm. H. Hill.*

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages and presenting the subject with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—*F. W. Hatch.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Denman.*

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—*Caroline L. Atwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Bond, A. M.*

I believe the work will be a valuable and much needed addition to our school text-books.—*Herman Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*L. M. Bryant.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value in special pleadings and its advocates at the forum.—*John Curry.*

The subjects upon which you treat herebefore need too much neglected in the education of young men in America. Exactly calculated to interest and instruct, it will soon become a necessity in every lawyer's library.—*Charles A. Tuttle.*

Its clearness and comprehensiveness make it easy.—*G. W. Boole.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end, he seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no public work in which he has obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—*S. F. Bulletin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—*Alta California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. F. Times.*

Prof. Layres plunges at once "in *in media res*." He seizes a sentence (which is the unit in composition, whether written or spoken), holds it up before you; tears it to pieces before your eyes—or rather, he should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity as gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—*Idem.*

This is an age in which the occasions are rapidly multiplying, when educated men and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stanton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Maryville Appeal.*

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Travelling Agents.

Address DEWEY & CO., Mining and Scientific Press, San Francisco.

Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no sigas, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair.

Opinions of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

BANK OF BRITISH COLUMBIA,
San Francisco, May 24, 1866.
Recently, two of Wm. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor and in every way meet our fullest approval.

They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We deem the lock entirely burglar proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable.

As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it.

WM. H. TILLINGHAM, Sub-Manager.

We do hereby certify, that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and impossible to be picked. We have applied several to Vaults and Safes, to entire satisfaction to parties interested.

KITREIDGE & LEAVITT,
Pioneer Iron Works, cor. Fremont and Market sts.,
SAN FRANCISCO, May 6, 1867.

I do hereby certify, that Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safes and Vaults in every other respect as good as any other improved combination lock which I am acquainted with.

JOHN R. SIMS,
Vault Manufacturer, Oregon street.

JACKSON, April 27, 1867.
I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons:

- 1st.—Because it is impossible for either burglar or expert to pick it.
- 2d.—The lock being constructed without a key-hole, it cannot be blown to pieces by powder.
- 3d.—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making.

R. COSNER,
Attested by J. C. SHIPMAN, County Clerk.

JACKSON, April 27, 1867.
The undersigned, Treasurer of Amador County, do hereby certify, that I am now using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's Safe. I have no fear of any bystander gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe every few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it.

OTTO WALTHER,
Attested by J. C. SHIPMAN, County Clerk.

CALIFORNIA LOCK ARCADE.—A special premium was awarded Mr. W. C. Bussey, for his superior Combination Powder and Burglar-Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the Press several months since. At that time it was adopted by several banking houses in this city, and was now assured that the remarkable claims asserted in favor of the Lock at that time, have been confirmed since by its practical use. We feel an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly first fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates.—*[Mining and Scientific Press, Sept. 29, 1866.]*

They are the only SAFE LOCK ever invented. Every State and County treasury vault, and every bank and business place should have one.—*Amador Ledger.*

This is a lock in which a series of rotating annular tumblers is employed, and it consists of a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. For which he was awarded a special premium at the State Fair.—*[Sacramento Union.]*

We, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar-Proof Lock to be the most reliable lock constructed.

F. MARKY & C. F. KESSEL,
No. 18, Post street.

REFERENCES:

R. COSNER, Sheriff.
O. WALTHER, Treasurer.
W. JENNINGS,
G. H. INGALLS,
L. MC LAINE,
Supervisors.

Any good blacksmith can put this lock on safe doors, boxes or single old locks removed and this placed in their stead, to work one, two, three or four bolts, as the case may be.—*[See page 30 in Pacific Coast Directory.]*

A deaf or blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination.

ENLARGEMENT

OF THE

American Journal of Mining
Volume III, Commencing March 3.

In consequence of the remarkable success that has attended this Journal, the proprietors feel warranted in increasing its size to

Twenty Pages.

Thus making it the LARGEST and most COMPREHENSIVE Mining Journal on this continent, representing the Gold, Silver, Copper, Iron, Lead, Coal, Slate, Oil, and in fact all the Mineral interests of America, containing beautiful engravings, illustrating the latest improvements in mining, mining and metallurgical machinery.

The Journal has won the encomiums of the press of the entire country and Europe, and numbers amongst its contributors more eminent scientific men than any other weekly publication in America.

The reports of the markets in stocks, metals, minerals and ores, carefully corrected weekly, are an important feature of the Journal.

Subscriptions: \$4 per year; for six months, \$2.25—in advance; single copies, 10 cents. Specimen copies sent free. Address, WESTERN & COMPANY, 1716-lamy

Mining Notices.

April 18, 1868. apl8

Nuestra Señora de Guadalupe Silver Mining Company, Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-seventh day of March, 1868, an assessment (No. 31) of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. PFEIFFER, at the office, No. 210 Post street, or to the Treasurer, A. H. WILMANN, at his office, No. 637 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of April, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the nineteenth day of May, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.
Office, No. 210 Post street, San Francisco. ap4

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of March, 1868, an assessment of two (\$2) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 318 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twentieth day of April, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the sixth (6th) day of May, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.
Office, 318 California street, up stairs, San Francisco. Cal. mar21

San Francisco and Castle Dome Mining Company, Location of Works: Castle Dome County, Arizona Territory.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-sixth day of February, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
S B Stoddard	100	400	\$40 00
S B Stoddard	101	400	40 00
S B Stoddard	102	400	40 00
S B Stoddard	104	25	2 50
S B Stoddard	105	10	1 00
S B Stoddard	106	10	1 00
S B Stoddard	107	10	1 00
S B Stoddard	108	5	50
S B Stoddard	109	5	50
S B Stoddard	110	5	50
S B Stoddard	111	5	50
S B Stoddard	112	5	50
S B Stoddard	113	5	50
S B Stoddard	114	5	50
S B Stoddard	115	5	50
S B Stoddard	116	5	50
S B Stoddard	117	5	50
S B Stoddard	118	5	50
S B Stoddard	119	5	50
S B Stoddard	120	5	50

And in accordance with law, and an order of the Board of Trustees, made on the twenty-sixth day of February, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by John Middleton & Son, at their salesroom, No. 310 Montgomery street, San Francisco, Cal., on Tuesday, the twenty-first day of April, 1868, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. R. SMITH, Secretary.
Office, Room No. 16 Stevenson's Block, Cor. Montgomery and California streets, San Francisco. ap4

Machinery.

**VARNEY'S
PATENT AMALGAMATOR**
These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
171 San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO.,

Pacific Iron Works, 915 1/2 St.
San Francisco, Aug. 29, 1887.

BLAKE'S QUARTZ BREAKER!**PRICES REDUCED!**

MACHINES OF ALL SIZES FOR SALE

—BY—

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077
313 1/2 SAN FRANCISCO.

**BLAKE'S PATENT
QUARTZ CRUSHER.****CAUTION!**

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a release of the Patent, bearing date January 9th, 1886

This Patent secures the exclusive right to employ in Stone-Breaking Machines Up-right Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials are crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.
BLAKE & TYLER,
141 1/2 Agents for the Pacific Coast.

**NOTICE TO MERCHANTS
—AND—
MANUFACTURERS.****Moore's Patent Friction Hoist.**

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength; less danger in working; as goods require no slinging or lashing, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any fastening or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.
VULCAN IRON WORKS CO.,
By JOSEPH MOORE, President.
21 1/2 St. **JOSEPH MOORE.**

**HUNGERFORD'S
Improved Concentrators.**

MR. HUNGERFORD, having been absent in the interior during the summer months, and engaged in the construction of several Quartz Mills, which have also been supplied with his CONCENTRATORS, has now returned to this city, and is prepared to answer all orders for his Concentrators, which are built either at the Miners' Foundry, in this city, or at Goss & Lombard's, in Sacramento.

Orders addressed to him at this city, by mail or express, will be promptly attended to.
25 1/2 St. **MORGAN HUNGERFORD.**

A FULL ASSORTMENT OF
MOLDERS' TOOLS,
Constantly on hand and for sale at low prices, by
CHAS. OTTO & CO.,
Successors to Marwedel & Otto, 312 Bush St., a few doors above Montgomery, San Francisco. 22 1/2 St.

**Notice to Miners,
Well-Borers and Water Companies.**

M. PRAO IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAO,
81 1/2 St. Stove Store, No. 125 Clay street, below Davis.

Brodie's Patented Improvements**FOR THE TREATMENT OF
Gold and Silver Ores.**

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:
No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600
No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....850
No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Raynolds Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Raynolds Ranch" Mine, in Tuolumne county, California.
RAYNOLDS RANCH, Tuolumne Co., Sept. 28, 1886.
JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Crushers in constant use, at the Raynolds Ranch Mining Company's Mill, which is entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
Supt. Raynolds Ranch Quartz Mill.
R. P. JOHNSON.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1884. Further particulars will be afforded on application to the subscribers.
For the present it is not intended to grant licenses for the use of the improved German Barrel, for a longer term than twelve months. All persons desirous of procuring, without having recourse to local proceedings, for past infringements, or desirous of receiving Letters of License for the limited period named, are requested to address as below.
A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1886.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found to be the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.
A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22, 1886.

Infusoria.

The following, by Dr. P. H. Van der Wyde, is from the *American Journal of Mining*:

The fossil shells of the mighty family of infusoria, which have existed during countless ages, and are heaped up in astounding quantities, have added much more to the mass of materials composing the exterior crust of our globe, than the bones of all mammoths, hippopotami, whales, etc., which ever existed. Startling and incredible as this assertion may appear to some, it is none the less a fact, established beyond all question by the aid of the microscope.

Besides the localities mentioned in my former article, others are almost daily discovered, of which the soil has the same constituents. Even some of our most gigantic mountain ranges, such as the mighty Andes, towering into the air more than 25,000 feet above the level of the sea, their base covering a vast area of land, our massive limestone rocks, the sand that covers our wide-extended deserts between the Rocky Mountains, the soils of our boundless prairies—all these are principally composed of portions of invisible animalcules, so small that one cubic inch, weighing about half an ounce, contains not less than forty thousand millions of flinty shells, each one belonging to an individual living being. The same is the case at the extreme southern portion of our continent.

Darwin writes of Patagonia, that along the coast for hundreds of miles we have a great tertiary formation, including the well known extinct shells of that period, among them the famous gigantic oyster of one foot or more in diameter. The beds composing this formation are covered by others of a peculiar white stone, resembling chalk, but largely composed of infusoria, among which Ehrenberg recognized thirty marine forms. This bed which extends for 500 miles, and probably much further, along the coast, is more than 800 feet in thickness at Port St. Julian. Ehrenberg discovered in rock of the volcanic Ascension Island many silicious shells of fresh-water infusoria, and the same indefatigable investigator found that the immense oceans of sandy deserts in Africa were in great part composed of the shells of such animalcules.

The hazy and injurious atmosphere found near the Cape Verde Islands, and hundreds of miles distant from the coast of Africa, is caused entirely by a brown dust which, upon being examined microscopically by Ehrenberg, was found chiefly to consist of the flinty shells of infusoria, of which 64 were fresh-water species, and two marine. This dust is nothing but the finer portions of sand of the deserts in Africa, driven over the ocean by the periodical winds. The mighty deltas and other deposits of large rivers are also found to be filled with the remains of this vast family of minute organizations. Some of their deposits are at present still in the process of formation; as, for instance, not only the deltas of the Mississippi, Nile, etc., but also the annual valley-deposit of the beneficent Nile, that fertilizes so large a tract of country, consists, so far as its nutritive principles are concerned, of fossil infusoria. Ehrenberg with his keen, scrutinizing research, found these infusoria so diffused in it, that he could not detect the smallest particle of the Nile deposit, that did not contain their remains. He also found on examining the immense amount of mud at the harbor of Wismar, in Germany, that the yearly deposit there, contained a mass of animal remains, amounting in bulk to 23,000 cubic feet, and weighing forty tons. The chalks and flints of the English coast, contain in every cubic inch about one million distinct shells. The Paris basin, 180 miles long and 90 in breadth, abounds in infusoria and other silicious remains; and the towns of Richmond and Petersburg, in Virginia, are built on myriads of skeletons of marine animalcules, contained in a flinty marl twenty feet in thickness, and many miles in extent.

The well known hone used for sharpening razors and tools, and found in Turkey and Missouri, and many paving-stones, all contain and are sometimes entirely composed of, such organic remains.

PROTECTION OF TREES FROM INSECTS.—

From proceedings of the Entomological Society, London, 1866:—To drive away insects from fruit blossoms before they deposit their eggs, let the branches be sprinkled, at the moment the blossoms begin to appear, with a mixture of one part of strong vinegar and nine of water. It may be done with a syringe. The destruction of the fruit is thereby prevented.

WHY QUARTZ MINING OFTEN FAILS.—*Dicker's Mining Record* for Dec. 28th, has an article upon the status of the Australian quartz mines at the present time, a portion of which we quote as being, to some extent, applicable also to California: "If we take the majority of quartz mines which have been in existence any number of years, we find, almost invariably, that success has been delayed from want of either the courage or the means to invest at first, or the inability to resist the temptation afterwards of declaring early dividends. In other words, were all the capital requisite to open up the ground in a thorough way forthcoming first of all, the dividends from quartz mines would not only become larger and give a better return on capital, year by year, but would have a steadiness also they do not now possess. We see no reason to question that quartz mining of the right sort—we mean by that, undertaken with the caution and judgment usually brought into play in ordinary commercial undertakings—will, on the whole, prove an exceedingly profitable investment. The mischief is that we have so few men with capital who can afford to withdraw their money wholly from other pursuits, and invest it, for a sufficient length of time to get a return, in mining. Works are consequently hurried to a conclusion, and before sufficient time or money have been expended to develop the lode, the principal shareholders have grown too impatient to wait any longer, shares are sold for just what they will bring, a winding-up suit supervenes, and the nucleus of a profitable undertaking is for an age perhaps entirely lost sight of. We have in our recollection scores of mines thus mismanaged, from which profitable results have after a lapse of time been obtained. Thousands of pounds are invested in machinery, to keep which employed after it is erected its owners have frequently not sufficient courage to invest as many units. Such a proceeding is about as reasonable as if a shopkeeper were to lay out a large sum of money in a place of business which could be of use to no one else, and, when completed, to find that he had not the courage to stock it."

"THE FROZEN TRUTH" IN ANATOMICAL DRAWING.—Prof. Branne, of the University, Leipzig, has just published a method of making accurate sectional drawings of the cadaver. The *Chemical News* says that he first freezes the subject by exposing it to a temperature many degrees below zero for a time, then with a fine saw he severs it in any desired direction. If proper saws are used, the cuts will be perfectly clean and smooth; over these cuts a stream of water is poured, which instantly freezes, as the whole operation is carried on in a room at low temperature, and the ice forms a transparent coating to the severed surface, which may be copied with the pencil at leisure.

POWDER FOR CLEANING JEWELRY.—The high price of an excellent powder much used by European jewelers in finishing and polishing gold, induced Dr. W. Hoffman to analyze it. He found it consisted of 70 per cent. of oxide of iron and 30 per cent. of chloride of ammonium (sal ammoniac). It is made by subjecting iron to the action of hydrochloric acid. After the hydrogen gas has ceased to escape, a solution of sal ammoniac is added. The precipitate is filtered at a very low temperature to prevent rapid evaporation.

A NEW WORK
—ON THE—
Mining and Metallurgy
—OF—
GOLD AND SILVER.
BY J. ARTHUR PHILLIPS.

This is a large royal octavo volume of over 500 pages, illustrated with numerous plates descriptive of Mining Machinery and Mining Operations.
It should be in the possession of every Miner and Metallurgist on the coast.
For sale by

H. H. BANCROFT & CO.,
Dealer in Mining and Scientific Books,
San Francisco, Cal.

Our Patent Agency.
The Patent Agency of the Mining and Scientific Press has been signified with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1860.

Awarded the First Premium at the Paris Exposition.

ADAPTED
FOR
Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES
Fifty Per Cent.
LESS POWER
Than any Blower
now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Etna Iron Works, San Francisco, and many other places.
CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

THE PHILOSOPHY OF MARRIAGE, BEING FOUR IM-
portant Lectures on FUNCTIONS and DISORDERS of
the Nervous System and Reproductive Organs, to be had by
addressing and enclosing twenty-five cents, postage stamps,
to Secretary PACIFIC MUSEUM OF ANATOMY, Mon-
gomery street, San Francisco. 2v13-1y

"The Excellent"

Will not repair broken limbs nor leaky roofs; but it will
quiet the nervous and brace up the weak. It will give more
comfort to those suffering from dyspepsia or indigestion
than any preparation you ever tasted or heard of. The
first physician you try it, and it is made by
BARRY & PATTEN,
8v16-3m 413 Montgomery street, San Francisco.

BUSSEY'S LOCK.—From the richest to the poorest, all depend more or less upon the skill of the locksmith to secure to them the fruits of their toil; and, as a consequence, few inventions have been so severely tried as those connected with this branch of mechanism. The art of locksmithing has, of late years, become almost a science; and as the latest result, we are now able to say, with great confidence, of Bussey's California lock—"Eureka;" for we have found that which appears to offer the fullest possible security against the skill and device of thieves and burglars. See advertisement in another column.

SPONTANEOUS COMBUSTION IN THEATERS. A correspondent of the *Pail Mail Gazette*, says that a noted scenic painter gives it as his opinion that many theaters have been burned through spontaneous combustion in the heaps of trash that are allowed to accumulate. The refuse of the painting and property rooms is often swept together, and the varnish, tow, sawdust, bits of oiled rag, etc., together generate heat. Although scene-painting is done with water colors, oils are largely used in the property-room.

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

DISEASES OF THE EYE.—During a late visit to San Francisco, we fell in with an old acquaintance from this county, Mr. G. W. Purdy, who formerly resided at Forrest City. About two years ago, while under treatment myself, we saw Mr. Purdy at the office of an oculist in that city, with eyes badly inflamed and the sight entirely lost. We saw him a few months later at another physician's, but his case was scarcely improved, and seemingly hopeless. His eyes have now entirely recovered, so that he goes about his ordinary business. From his own lips we learned that the restoration of his sight was entirely due to Dr. R. R. Morgan, whose office is at No. 627 Sacramento street, between Montgomery and Kearny, who cured him in the short space of eighteen weeks. Mr. Purdy mentioned several remarkable cures which occurred in the practice of Dr. Morgan during the time he was under treatment, among which was that of Mrs. Jane Albert, of Brownsville, Yuba County, and several others. Mrs. Albert had been afflicted with sore eyes from early childhood, and for eleven months previous to treatment she had not been able to discern light, nor had she seen the features of her youngest child, twelve months old. She had heard of the remarkable cure of Leonard P. Eder, of Marysville, and Joseph E. Haskell, of Sacramento, and determined to try Dr. Morgan. The result was that she was able, after ten days, to read ordinary newspaper print. Mr. Purdy was of course greatly rejoiced at the recovery of his sight, after so many trials and failures with different physicians.

The above is clipped from the *Mountain Messenger*, of February, 1868. 10v16 3m

MEDICAL AUTHORITIES have announced that not less than one-fifth of the entire population of the United States are afflicted with Neuralgia in some form. Surely the man who can safely remove such a vast aggregate of pain is a great public benefactor. Such is Dr. Turner, of Boston, in Massachusetts. His "Universal Neuralgia Pill" is pronounced on all hands, to be an entirely harmless and perfectly certain remedy for this most torturing of all known diseases. See advertisement in another column.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions twenty per cent. cheaper than ever before, and the very best articles in market. The store is located at 115 Sulter street, Lick House Block. 22v15tf

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

Sheffield Scientific School

Of Yale College, New Haven, Conn.

This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.

The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.

Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY AND MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING AND METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY AND GEOLOGY. AND 7—SELECT COURSE.

Advanced students are also admitted to optional courses, and if already College graduates, are received as candidates for the degree of Doctor of Philosophy.

Tuition, \$125 per year of forty weeks.

The Libraries, Museums, Laboratories and Apparatus, accessible to students, are various and expensive.

For copies of the Annual Circular and Report, letters may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 13v6-1y 16p

PREMIUMS AWARDED AT ALL THE FAIRS.

We beg leave to call your especial attention to the

EXCELSIOR

Double-Acting Suction and Force Pump.

Hooker's Patent, Aug. 15, 1865.

This Double-Acting Suction and Force Pump, the best in use, is more simply constructed, more durable, and has larger and more direct ports for receiving and discharging water, and is warranted to furnish more water, than any other Pump of equal caliber. It has Puppet Valves, faced with vulcanized rubber, which cannot be wrongly placed in the Pump. The valves can be changed without disconnecting air-chamber, suction or discharge pipes.

In case of necessity, the Pump can be run at any high rate of speed, and will furnish water proportionately. The Excelsior Pump is equally adapted to use for surface and deep wells or shafts. It can be run by windmill or horse power for irrigating purposes; also by hand or steam power on steamers and ships. For domestic use, no better Pump can be found.

Fig. 3.

By simply loosening the nut seen at the base of the Air-Chamber, the discharge nozzle may be turned, thus making a right or left-hand Pump.

Fig. 3 represents a Hand Pump, which works very easy, and [with even power. Fig. 4 is a 6-inch Mining Pump, showing adjustable bonnet of the valve chest.

For Circulars, or further particulars, inquire of or address J. W. BRITTAN & CO., Agents 120 Front street, San Francisco; H. J. BOOTH & CO., Union Iron Works, First street, or CUSHING & CO., Prop'rs., San Francisco.

THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises SIXTEEN PAGES (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS.

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

THE MINING AND SCIENTIFIC PRESS is now in its SIXTEENTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866:

RESOLVED, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

SPECIMEN NUMBERS of the Press and Patent Circulars, sent free.

The Cornish Pumping Engine.
California Acad. of Sciences.
Mechanical Miscellany.—
Paraffine for Oiling at a High Temperature; Self-Adjusting Piston; Movable Seat for Slide Valve; Malleable Iron; Another New Steel; Colored Glasses for

Steelmakers; Anti-Incrustation.
Scientific Miscellany.—
New Process in Mineral Analysis; Hotting; Decay of Building Stone; Granite a Modification of Stratified Rocks; Detection of Sulphur in Petroleum; New Windows best for Photographers.
Mining Summary.—Comprising late intelligence from the various counties and districts in California, Arizona, Colorado, Incotab, Idaho, Montana, Nevada, and Oregon.
New Patents and Inventions.
Notices to Correspondents.
New Incorporations.—List of Officers.
San Francisco Market Rates.
San Francisco Mining Shareholders' Directory.
San Francisco Metal Market.
Stock Prices—Bids and Asked.
San Francisco Weekly Stock Circular.

J. ROSS BROWNE'S REPORT.—Fifteen thousand copies of this forth-coming report are to be published for the use of the House of Representatives. The matter was discussed on the 26th ult. Some objection was made by Mr. Cavanaugh, delegate from Montana, on the ground that the report was incorrect in its showing of that Territory; the gold production, for instance, being reported as \$12,000,000, whereas it is in fact \$20,000,000. The delegate from Idaho, Mr. Holbrook, however, was in favor of the printing of a large number of copies,—although the same thing was to some extent true of his own Territory,—inasmuch as the report contained a large amount of valuable information. Mr. Ashley of Nevada spoke of Dr. Blatchley, who furnished Mr. Browne with the items in regard to Montana, as a trustworthy and well-informed man.

SACRED CONCERT.—The Handel and Hayden Society will give a grand sacred concert at Dr. Scudder's church, Mission street, on Tuesday and Thursday evenings. An excellent programme has been prepared, which will include Mendelssohn's Hymns of Praise, entire, together with selections from Handel's Messiah. The following well known soloists have been engaged for the occasion, who will be assisted by a full and efficient chorus, numbering about 100 ladies and gentlemen, all of superior choral talent. It is designed that this shall be one of the fullest and most complete concerts of sacred music ever given in San Francisco. The concert will be under the management of Prof. J. Thorpe, as manager; Prof. G. A. Scott, organist. Tickets, admitting a lady and gentleman, \$1.50; Single tickets, \$1.

CRANMER'S SELF-LOADING GUN.—In our notice of this gun, two weeks since, we neglected to mention that ample provision was made against its heating by the constant immersion of the cylinder in water. The gun may be seen in operation every Saturday at four o'clock P. M., at the shooting gallery, North Beach, near the foot of Powell street. The inventor has spent a great length of time, and much money in bringing this gun to its present degree of perfection, and is now desirous of finding some one who will take an interest in the patent, and in bringing the invention to practical use.

The American Submerged Pump.

In presenting this Pump to the attention of the people of the Pacific Coast, the proprietors truly say that no untried novelty is offered. It has been extensively used in the New England States, thoroughly tried and tested, and is daily increasing in favor. It has been successfully used in Egypt for pumping quick-sand waters; in South America for government docks and irrigating purposes; in Canada and Nova Scotia for mining purposes; and in Cuba for boiling syrups.

As a ship pump, it has received the approval of the French and American Lloyds, and is now receiving the consideration of our own government, by the Life Saving Commission, which, if adopted, will require it to be used on every passenger vessel in the Republic. It has also been used for pumping coal tar, for testing boilers, and for pumping boiling water into boilers. And in each and all these uses, it has sustained every test that it has been put to.

Its principle is that of a double-acting force pump, with a heavy double-acting piston, cast in one piece, and a double-acting iron valve within the same, without the use of leather valve or any packing whatever.

The engraving hereto annexed represents a sectional view of the pump. When the barrel D is raised, as shown, the valve C' is also raised, admitting water, as shown by the arrow; at the same time the puppet valves I, I, have seated themselves on the lower aperture, so that the water from the chamber B may pass as shown by the arrow at F, into the barrel D. On the return stroke the barrel D with the piston E, which are cast in one piece, drops, forcing the water from the chamber A, by the puppet valves I, I, being raised to their seats on the upper aperture, and closing C'; the valve C is at the same time raised, allowing the cham-

ber B to be filled. This peculiar arrangement of the puppet valves I, I, gives a solid head piston each way of the stroke.

In working this pump, the chief portion of the friction due to packing, which the books set down at 33 per cent. of the power applied, is saved;—the piston being so nicely turned and fitted to the chamber that it will operate, to a considerable extent, as an air pump; hence, when submerged in water it has a water packing and water lubrication. The channels of the water coming to the center line of the piston, cause an equal bearing on all parts thereof, and a great saving of power; as may be readily shown by closing up one of the puppet valves, I, I, and taking the water from one side only, as is done on pumps in ordinary use. The same effect is produced when the discharge orifice is placed upon one side, as in ordinary force pumps. The continuous action due to a rotary pump is here more simply and economically obtained by a plunger, maintaining a constant stream without the use of an air chamber.

It is next to an impossibility for this pump to choke; it will clear grain, dirt, gravel, etc., with perfect ease. It has been thoroughly tried in this respect, and the most ample testimonials are given of its efficiency.

This valuable invention is now for the first time offered to the public on this coast. Among its advantages may be enumerated, First, Simplicity: The entire pump is composed of but six parts, all of cast iron, which can be readily put together by a common laborer. Durability: The fact that it is always submerged, and self-lubricated and packed, is sufficient evidence of its advantages in this particular. It is applicable to the coldest climates, as it never freezes, except when the fountain-head becomes frozen, from the fact that it is entirely submerged, and that no water can remain in the pipe when the pump is not in motion. Its advantage in the economy of power has already been sufficiently shown. In point of cheapness and economy, it is claimed that the weight of metal employed to do a given amount of work is considerably less than in that of pumps in ordinary use.

All those who desire to satisfy themselves more fully with regard to the advantages of this pump, can do so by a personal inspection of its operation at the yard of the stable in the Post-office block, where they will find one of the pumps in operation, which will be cheerfully exhibited and explained by the agent, Mr. C. F. Mudge.

THE GIANT POWDER.—We have received a letter from Yuba County, speaking of this article in high terms. On the other hand, we have seen an item in the *Alta* which speaks disparagingly of it; saying that Dr. Fox has not met with the expected success in Nevada County, where he is now experimenting with it; adding, however, that Capt. Oliver reports it as working well in Tuolumne County. It is proving satisfactory in its operation at the quarry in this city, whence the rock for the sea-wall is now being taken.

Co-operation.

The system of coöperation for conducting the various branches of trade and mechanical industry, is gradually growing in favor throughout the whole civilized world. Wherever it has been fairly tried, it has generally worked well, and been productive of good results. It commenced in England under the direction of twenty-eight weavers of Rochdale. Having invested \$5 apiece in a provision store, in a very few years their stock had increased to \$1,000,000 working capital.

In England alone, to say nothing of Germany, France and the United States of America, there are now in existence over 700 such societies,—embracing about 200,000 members.

A beginning of such a system of labor has been made in San Francisco. We have already made allusion to the Coöperative Union Grocery, Sutter street, which is now in admirable working order and daily growing in prosperity. The society recently organized here for the benefit of the working women of this city, has also received due attention.

Long prior to any movements upon the subject on this coast, the readers of the *PRESS* were presented with something of the history of these associations in other places; of the general principles on which they are conducted, and of some of the good effects which might be expected from the same—more particularly as a remedy for some of the evils growing out of the "capital and labor" question. During the past week we have visited two establishments, formed on this plan, for the manufacture of boots and shoes.

The Journeymen's Boot and Shoe Coöperative Union, 413 Broadway, was incorporated Aug. 21st, 1867. They are now manufacturing every class of ladies', misses' and childrens' boots and shoes. Ready sale is found in this city or vicinity for all their goods as fast as they are made up. The United Workmen's Boot and Shoe Manufacturing Company, opened in January last at 416 Battery street, third floor. The stockholders consist solely, as we understand, of first class boot and shoe makers. They employ from twenty to thirty men, chiefly stockholders, who average about \$3.50 per day by piece work—ten per cent. of wages of working members being retained till it amounts to one share. In this way they are constantly making accessions to their stock. The business at present is confined exclusively to men's work—all of first quality; such as pegged kip and calf boots and shoes; screwed do.; Hungarian nailed kip and channel nailed calf;—from 75 to 100 cases being turned out per month.

The goods are represented as made of the best material in the market, and commanding remunerative prices. Roberts, McNish & Co., California street, have thus far purchased them as fast as they could be manufactured.

Other associations of a similar character will receive attention in due time.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Cornish Pumping Engine—An Imperative Necessity for Deep Mining.

EDITORS MINING AND SCIENTIFIC PRESS: My last letter deprecated the folly of, and consequent waste occasioned by, the non-expansive engines supplied to the U. S. Navy; and referred to the statistical examples of the best mechanical engineers, for the comparative advantages derived from expansion of steam, in all engines on land and sea; and that these advantages had been more particularly demonstrated in the Cornish Pumping Engine during the last century.

The Pacific slope is destined to become an extensive mining field. Each year will deepen the developments on mineral veins, and the difficulties of pumping water and hoisting stuff therefrom, will geometrically increase as depth is attained; so that many mines will waste their proceeds, and succumb for want of proper mechanical appliances for deep mining. It is therefore imperatively necessary that you should profit by the experience of others, and discard your non-expansive rotary engines, that are entirely unsuited for pumping water from deep mines, from imperfection of structure and extravagance of fuel; or continuously recurring difficulties and accidents will have to be encountered, and these temporary machines discarded for the more substantial and permanent pumping engine, at a time when, from excessive water and concomitant expense incurred by delay of operations under full staff, the cure of the evil, will cost far more than the prevention.

It is not uncommon in mines from 1,500 to 2,500 feet deep, that pumps of from 15 to 20 inches diameter, varying from eight to ten feet stroke, are required,—where a hindrance of twenty-four hours would be ruinous to the financial balance; so that nothing but the most efficient arrangements can insure continued and successful labor, with economy. The experience of Cornwall in this department, is more valuable than that of all the world beside. I will therefore endeavor to describe the "Cornish Pumping Engine,"—which I deem vastly superior to all others, and hope it may be adopted here as elsewhere, before it is too late; as it is equally well suited for all stages of mining, intervening between the discontinuance of the "horse-whim" harrel, and the deepest developments of man; saving as it does, in every way, from its admirable adaptation to the work,—not only in fuel, and in wear and tear, but also in breakages, hindrances, and consequent loss of mines. This engine embodies many peculiarities;—some of which may be described as follows. We will suppose that a ponderous scale beam is poised on what is termed the "hoh" wall of the engine-house; the inner scale-pan being suspended by the piston rod, constitutes the piston of the cylinder, and the outer scale being the representative of the various pumps vertically suspended to the outer end of the beam by the main (direct connection) rod, that extends from surface to within some fathoms of the bottom of the shaft. It has no crank or fly-wheel, nor is it confined to an exact undeviating length of stroke, but it can be moved at pleasure of the worker, for all desirable lengths; and is in itself continually varying within certain limits, as the load or steam's pressure may increase or decrease, etc.

Engines of this description have varying sizes from 20 to 144 inches in diameter of cylinder, of from nine to twelve feet stroke of piston, and from eight to ten feet in the pumps; the comparative length of inner and outer ends of main lever being governed thereby after the relative ratio of one foot eight inches for one foot of the stroke; a

ten-foot stroke of piston having sixteen feet eight inches for inner length of beam, the outer length being for a nine-foot stroke, fifteen feet beam, which are the lengths preferred, for large and small engines alike; because of the better actions of expansion and practical pumping by quicker and more capacious stroke.

The number of strokes per minute is regulated by the screw governor, of a hydraulic time keeper,—either for an intermittent motion of one stroke in ten minutes, or any required number up to 12 strokes in one minute; being sufficient for the greatest variations that are required in mining; and extremely exact for regular extraction of water. The time of making individual strokes is also varied, and made subservient for the requirements of both the engineer and shaftmen, by elevating the load by *more or less expansion*, in from two to six seconds, and returning the pump-rod with attachments for ensuing strokes, by balance in from four to ten seconds; the latter being sometimes further restricted in dangerously quick descent from pump-valves chipping, by the partial closing of the equilibrium or outlet valve.

As the weight of the pump-rod with fixings, is more than the weight of the water to be lifted, or the work to be performed, the action has been reversed; and the power of this single-acting steam engine is employed only to lifting their weight, which in descending performs the work, on the consecutive plungers or force-pumps, placed at distances of from 150 to 300 feet asunder, and which extend from the surface to the bottom or suction pump, that is invariably used in sinking shafts; but promptly substituted by plunger fixings as soon as possible, to relieve the extra strain from the main rod, lessen friction, and the weight in the balance box.

These force pumps are sized for the quantity of water to be pumped from their respective levels; which is a matter of careful consideration, to prevent wasteful differences that would have to be belifted in their successive supplies to keep the larger pumps full of water.

The suction or "draught" pump is always made larger than those above, to give the shaftmen the advantages of its ventilation, certainty, durability of leathers, and more speedy clearance of the water from the very bottom, previous to drilling or charging sinking holes.

The pumps should never be worked faster than is necessary for their full supply; which is so exactly and beautifully performed by this engine, that a whole watch may be frequently passed without alteration of speed, or excess in the number of strokes.

The engine has four balanced double seated valves, called the governor, steam or expansion, exhaust, and equilibrium; the first is varied by a screw motion, the second, third and fourth by handles, and self-acting leather-faced slides or "plugs" attached to and worked by two parallel and perpendicular rods from the main beam, which plugs are adjusted to the varying requirements of the work to be performed.

Modern engines are all fitted with air pumps and condensers, but they may be worked as puffing engines, for peculiar places.

The boilers are known by the name of Cornish boilers; and composed of two cylinders, secured by one end plate at each end; the fire being lighted in the inner cylinder; the flues range through the inner tube back by both sides, and pass by one channel underneath the boiler, away to the chimney, at a less temperature than 212°; the gases from combustion being deprived of all efficacious heat. They are each provided with stop and safety valves, glass gauges, and gauge cocks, separate dampers, feeds, etc., so that one or more may be worked; thereby enabling the workmen to repair, or cleanse, as often as may be required, without delaying the workings of a deep mine.

The pressure of steam is from thirty to sixty pounds per inch, but generally about forty pounds, and is admitted and released to and from the engine as follows: The engine worker standing before the handles, slips the catch of the exhaustion handle; this valve opens communication to the condenser, and at the same time the motion admits the injection water from the cistern to the condenser, which being allowed about two seconds for entrance and condensation, the catch of the steam is lifted, and the steam handle and valve opens and admits steam, properly regulated by the governor valve's screw, by slow additions; the descending motion of piston rod or beam being closely watched, so that, if necessary, the steam valve may be closed, the exhaustion from beneath suddenly stopped, and the engine's motion arrested by the cushion of retained vapor; the equilibrium handle and valve is next opened

to allow the steam to escape from the top of the piston to the bottom thereof, (in equilibrium) just as fast as is necessary for the ascent of piston and descent of pumps by the balance, which must be now adjusted by throwing the balance rock into or out of the box. The cylinder full of steam is retained until the exhaustion valve opens to repeat the next stroke to support warmth, and prevent inhalation of atmosphere, that would vitiate the perfect vacuum; separate steam is also turned into the piston-rod stuffing-box for similar purposes, and the whole of the surfaces of boilers, steam boxes, pipes and engines are thickly covered with a non-conducting substance. A few strokes is all that is necessary, with skilled drivers, to render the engine self-acting and properly balanced; the correct speed only remains to be ascertained and regulated. Suitable preventive catches or stops are made, of great strength, at each end of the stroke, so as to prevent accidents from loss of load, etc., etc.; and a code of numerical bell signals are used to inform the drivers of the requirements of the shaftmen; thus, any number above ten, means, to work or stop the engine; seven, work faster; six, slower; five, take her up slowly; four, lower slowly; one, stop or hold fast, etc., etc. These are performed by the peculiar adaptability of the engine for the work, as well as all other requisite movements, with great facility, exactness and dispatch, (that can be approached in precision, by no mechanical movement, but that of the steam hammer,) and the engine shows moreover to an experienced eye, on the face of her every movement, the faults of the pitwork, and where the error is located.

These eminent advantages, from the general adaptation,—of direct action, intermittent motion, slow combustion and generation, minimum friction and radiation, with maximum expansion of steam,—cannot be despised with impunity; as they reduce the consumption of fuel from 50 to 200 per cent., as compared with the general engines now placed on this work; and enable the miner to attain thrice the depth, with much less anxiety and danger. I would therefore in conclusion, most emphatically impress the importance of the Cornish arrangements for pumping, both above and below, in the steam engine and pump fixings, as possessing superlative advantages, for efficiency and economy, that can be fully appreciated only by the most experienced practical men;—but which are, notwithstanding, so well recognized in the English mining market, that no prudent man will buy shares in a mine, having an "extravagant rattle-trap rotary" for pumping; but will prefer waiting for the regular pumping engine that must inevitably follow, to properly develop a mine, even where fuel, labor and materials are cheap.

If such arrangements are discarded there, how much more strongly should they be condemned in this expensive country, where greater profits are expected to be realized from mining? To be forewarned has been considered half the battle; so let those interested take warning and be prepared for these contingencies, before it is too late.

J. S. PHILLIPS, M. E.

San Francisco, April 13th, 1868.

THE PACIFIC COD FISHERIES.—Sixteen vessels, aggregating about 2,000 tons, have already left this port, the present season, to engage in cod-fishing on our northwest coast. A large amount of capital is also invested in salmon fishing in that region. The fisheries along the coast of Alaska are probably superior in variety and extent, and in facilities for catching and curing, to those of any other portion of the world; and for that business alone, with its incidental advantage of a nursery for seamen, will, in a few years, be worth all or more than it has cost the National Government. The stupidity, to say nothing of the discreditable nature of the opposition in Congress to the prompt payment for the Alaska purchase, is most astonishing.

RISE OF REAL ESTATE IN NEW YORK. On the 10th of March 246 Central Park lots were sold at auction. The aggregate amount of the sales was \$1,480,000. These lots belonged to the estate of Sarah Falman, deceased. Twenty years ago the "farm" which comprised this property was offered for \$6,500,—and the offer declined.

TO DEODORIZE PETROLEUM.—Dr. R. Wazner says that the disagreeable odor of petroleum can be taken away by treating the oil with a solution of plumbate of soda.

[Written for the Mining and Scientific Press.]

"Expansion of Steam."

EDITORS PRESS:—The article on "Economy of Fuel by the Expansion of Steam," by Mr. J. S. Phillips, in the PRESS of the 11th inst., was apparently written under the impression that the value of expansion, and the merits of Cornish engines were not properly understood in this country.

This is not the case, however, as he would have known if he had been familiar with the history of the expansion controversy among us during the last ten years—since the famous Erie experiments. Mr. Isherwood (the present head of the Bureau of Steam Engineering in the U. S. Navy), proved by those experiments that an engine might be so contrived, that under certain circumstances expansion would be a source of loss rather than gain. Now, Mr. Isherwood not being fitted for an experimentalist, either by the gift of intuition or by previous practical and theoretical training, failed to draw the proper inferences from his own experiments, but jumped to the conclusion that the advantages of expansion were chiefly imaginary, and that engineers from Watt downward had been hugging a delusion. It happened, unfortunately for his country, that from the commencement of the late war until the present time, he has occupied a position that has enabled him to carry out his ideas in most of the machinery constructed for the navy. The experiments referred to by Mr. Phillips were really gotten up to sustain Isherwood's views; and it ought to be remembered that all prominent engineers in the country unanimously dissent from them. The discussion has proved, however, that the full value of expansion cannot be realized without using steam thoroughly dry, jacketed cylinders, high speed of piston and careful adjustment of valve-motion, area of ports, etc., all of which involve increased care and skill both in construction and attendance. It is for this reason that mining engineers on this coast do not generally carry the principle to its utmost economical limit.

Mr. Phillips says no modern engine is now made for H. M. S. Navy, with even a common slide, to carry steam full stroke; neither are they so made for the U. S. Navy, as the extent of Isherwood's heresy consists in maintaining that for ordinary marine engines, the most economical point of cut-off is from ⅓ to ½ of the stroke; his engines usually run at the former point.

On the Cornish engines it may be remarkable that the duty of one hundred and ten millions was not an average, but an exceptional case; the last report from this district in the London *Artisan* gives an average duty of less than two-thirds of this amount. Also in computing this duty the water is not measured, but is reckoned as equal to the displacement of the pump plunger at each stroke, which invariably gives too high a result. Estimated in this way, the duty of the Brooklyn Water Works engine, cutting off at one-third, is superior to the average performance of the Cornish engine.

As a type of expansion engine, it is cumbersome and costly; and although used to some extent in the Eastern States, there are few localities in California where its economy in fuel would outweigh these objections.

The Corliss engine, which varies the point of cut-off to suit the slightest variation in the load, and the Allen engine, are examples of the best American practice. The latter engine, with a cylinder only twelve inches diameter, and a stroke of twenty-four inches, initial pressure of steam 60 pounds, cut off at one-fifth, development 100 indicated horse power, and works up to this extraordinary power on a consumption of fuel fully as low as that of a Cornish engine costing five times as much. Its valves are all operated by a single eccentric, point of cut off self-adjusting to the load, and the indicator diagram shows the lines of admission, expansion and exhaust to be almost absolute perfection!

Mr. Phillips' advice to steamboat proprietors (to try expansion) is very good, but as there is not a steamboat engine running out of San Francisco that does not use steam expansively, nor probably a person in charge who is not aware of its advantages, the experiments on "full stroke versus expansion," will hardly be repeated on this coast.

MACHINIST.

San Francisco, April 14th, 1868.

Mechanical.

PUDDLING.—*Engineering* gives an account of an experiment on some cold-blast Staffordshire iron, in which the first part of the process showed a great decrease in the *silicium*, increase of the carbon contents of the iron; and thus remarks: The question naturally arises, how this increase in the percentage of carbon is possible under the influence of an oxidizing process such as the iron was exposed to. The hypothesis started by Dr. Calvert himself in 1857, that carbon may be taken from the flame or gases in the furnaces, is contrary to all that is now known on this subject, and cannot be maintained; yet the analysis shows such an increase, amounting to about 25 per cent. of the original quantity. There is only one way to explain this result. If we look at the manner in which the silicon disappears from the iron, we find that it becomes transformed into silicic acid, which again combines with a certain quantity of oxide of iron for forming a slag. The oxide of iron may be obtained from the fettling of the furnace, but at the early stages of the operation it is much more likely to be formed by the oxidation of the iron itself. Every pound of silicon requires at least one pound of iron for its conversion into slag; but, as a rule, slags richer in iron are formed in puddling. The removal of 2.5 per cent. of silicon, therefore, corresponds to a simultaneous oxidation of 2.5 to 7.5 per cent. of iron, which will bring the total loss of material during this operation to about 10 per cent.

The conclusion is, that the reason of the greater economy in puddling, on the Continent, as compared with the same in England, is the less amount of silicon in the iron. Most of the pigs used in England are of gray iron, which contains a large proportion of this substance.

PARAFFINE FOR OILING AT A HIGH TEMPERATURE.—The oiling of machines at high temperatures, say about 200 degrees, presents a great difficulty. The lubricants at present in use, are decomposed by the heat, and leave a residue or coating often as thick as varnish, and very sticky,—the adherence of which on the sides of the cylinder hinders the movement of the piston. The problem is to find a substance unalterable at 300 degrees or 400 degrees,—and cheap. The class of paraffines furnishes such, in melene ($C^{30}H^{50}$)—insoluble in water, soluble in the fixed oils, volatile without decomposition, and not boiling under 370 degrees. At the ordinary temperature it is of the consistency of wax. It is also an infallible preservative against oxidation. The above is translated from *Cosmos*, by the *Journal of the Franklin Institute*.

SELF-ADJUSTING PISTON.—Mr. Sweet says he adopted this plan in the construction of this piston:—"I bored the cylinder as perfect as I could, then fitted the piston so tight as to require the strength of two men to move it; then set a heavy tool in the lathe, and carried the point against the face of the piston. I then plunged the piston into a kettle of boiling water, where it was allowed to remain until it had obtained the temperature of the water. I then placed it in the lathe, and started a chip as soon as it could be done; this gave me the size of the piston. I then let it get cool, set the tool forward, and turned the piston off. The bronze rings I make $\frac{1}{4}$ inch for a 12-inch piston. A set will last a year without appreciable wear of the cylinder."

MOVABLE SEAT FOR SLIDE-VALVES.—R. Napier and Mr. Rankine propose to give a slight sliding motion to that part of the valve which contains the induction edge of the cylinder ports, so as alternately to contract and enlarge those ports at each stroke of the engine. This is accomplished by means of a movable seat, with a rod and a third eccentric to give it motion. The effect is the same as would be produced by two different slide-valves.

MALLEABLE IRON.—Mr. St. John Vincent Day, C. E., in an elaborate article for the *Colliery Guardian* says: Since the year 1784, when Cort introduced the process of puddling, there has not been any really great advance made in improving the general results obtainable from the conversion of crude or pig into malleable iron in the puddling furnace, until very recently. The failures which have been encountered have, however, increased our stock of information upon the subject. It is impossible to make good commercial iron from the ordinary ores of this country by the Bessemer process. Mr. Bessemer has himself on several occasions openly confessed that he could not succeed in making good malleable iron by his process, purely on account of the impossibility of removing sulphur, but more particularly phosphorus, in the converter; his early experiments showed distinctly, that whilst the highly oxidizing effect of the blast injected into the converter was most efficient in removing carbon and silicon and some of the lesser impurities, still the phosphorus and sulphur remained untouched; the immediate consequence of which has been, that his process has never come into practice for making iron from the ordinary run of British ores,—by far the larger portion of which contain notable quantities of these two elements, of which phosphorus is the greater enemy, its presence rendering the iron *cold-short*, whilst sulphur has the opposite effect of rendering it *red-short*.

ANOTHER NEW STEEL.—The *Colliery Guardian* speaks of a new steel particularly adapted for cutting tools, recently patented by Mr. J. P. Smith. With it a Bessemer steel piston-rod had been turned from end to end, at the rate of 200 feet per minute; while an ordinary tool was blunted with a few turns of the lathe. The new material is capable of the most delicate degrees of temper. The journal goes on: Mr. Smith has also shown how to produce a bar of metal which shall be common cast iron for any part of its thickness, and coated all over, or at one or more sides, with any required thickness of steel. For instance, if we take the case of a locomotive engine motion-bar, it can be made with as thick or as thin a coating of steel on the wearing side as desired, and yet perfectly united and thoroughly in one piece with the cast iron below. Mr. Smith has also cast projectiles with a very hard steel punching front and a soft rear, his object being to produce shot that will not easily break when fired against armor plates or stone forts, but which, on account of the great hardness of their striking ends, will possess great punching endurance. It is extremely curious and interesting to examine the fractures of such compound castings; the junction of the two metals does not take place gradually, as we might expect, but a perfectly straight, even, and true line marks the boundary of the two conditions of the metal.

COLORING GLASSES FOR STEELMAKERS.—At the Atlas Steel Works, Glasgow, the following is a plan for enabling the observer to determine the point when the combustion of the carbon is completed. A square thin frame contains a combination of colored glasses; for instance, one dark yellow and two blue, or any other colors giving together a very dark neutral tint. Looking at the flame through these glasses, affords the double advantage of preserving the eye from the unpleasant effects of the intense light, and of making all smoke and other disturbing changes invisible. The flame, when thus viewed, looks white so long as the intense brilliancy due to the burning up of the carbon continues, but changes to a deep red at the moment all the latter has been consumed.

ANTI-INCORUSTATION.—To prevent the formation of adhesive sediments in a steam boiler, mix 125 kilograms of crystallized chloride of barium dissolved in fifty of water, with twenty-five kilograms of hydrochloric acid having a specific gravity of 1.20; apply fifteen parts by measure of this acid solution, to every 1,000 parts of water used in the boiler.—*Gas Light Journal*.

Scientific Miscellany.

New Process in Mineral Analysis.

Frank Wigglesworth Clarke, S. B., in a paper published in the March number of the *American Journal of Science*, describes his new method of resolving refractory minerals,—such as emery, chromite, tinstone, rutile, etc. The mineral after being pulverized, is mixed in a platinum crucible, with three parts of fluoride of sodium, and upon the top of the mixture is placed twelve parts of hi-sulphate of potash. The latter should not be mixed with the others. Upon heating, the mixture boils up, and after a time settles into a clear tranquil fusion. The mass obtained is, in the case of some minerals, completely soluble in water. "In other cases, basic salts are formed, which, although, insoluble in water, dissolve readily in hydrochloric acid." Most of these last are, however, made soluble in water, by being treated with strong sulphuric acid in the crucible, after cooling,—and again fused.

Tinstone, treated as first described, gives a white mass, almost entirely soluble in cold water. The same is true of rutile, the yellowish white mass being entirely soluble. Ilmenite, (titaniferous iron,) is completely decomposed, and is mostly dissolved in cold water. It leaves, however, some basic salts which dissolve readily in hydrochloric acid. If treated with sulphuric acid, as above described, it is completely soluble. Chromic iron was completely fused in less than three minutes, over an ordinary Bunsen's gas burner. The cooled mass is light green, partly soluble in water alone, and partly in hydrochloric acid. When treated with the sulphuric acid, a larger proportion is soluble in water alone. Emery is rapidly and easily resolved, and a large proportion is soluble in water; treated with sulphuric acid, it is entirely so. The same is true of hematite. Quartz sand was easily fused, and the resulting white mass almost entirely soluble in water. Pure, finely pulverized cryolite may be substituted for fluoride of sodium, where the introduction of alumina is not objectionable. The bi-sulphate of soda may be used instead of the potassa salt, although the latter is preferable.

In no case did the fusion required a longer heat than five minutes;—and generally three was sufficient. In every case, an ordinary Bunsen's burner was sufficient to produce the heat required. In all cases, the resolution of the mineral was absolutely perfect. All the silica was got rid of at once, and all the bases were converted into sulphates. The last is a great advantage when iron is to be determined volumetrically by means of hypermanganate of potassa solution.

This process has many advantages;—and especially in the examination of ores, slags, and cinders containing iron. A perfectly clear solution is obtained at once without filtering, and it is only necessary to reduce the iron by hydrogen, and then to titrate.

The fluoride of sodium is thus prepared: Cryolite, finely pulverized, is decomposed by boiling with caustic soda solution. Fluoride of sodium is deposited as a jelly-like mass at the bottom of the vessel. This deposit is washed with cold water, until the washings have no longer an alkaline reaction, and afterwards purified by repeated solution and evaporation. Iron vessels, very clean and free from rust, are used.

HOTTINA.—This powder, invented by M. Hotin of Paris, will make linen fire-proof without impairing its whiteness, when mixed with equal quantities of starch and gum. The powder is prepared by adding a little ammonia to an acid solution of phosphate of lime, and filtering with animal carbon, then evaporating until concentrated, when five per cent. of gelatinous silica is added; the whole is then evaporated and the resulting crystals are pulverized.

DECAY OF BUILDING STONE—AND ITS PREVENTION.—John Spiller, F. C. S., who has especially studied this subject, concludes that the decay is due to the corrosive action of sulphurous and sulphuric acids in the atmosphere of large towns, resulting from the combustion of coal fuel. Upon dolomite and the various limestones, these gases are especially destructive. Scrapings taken by him from the decayed portions of the new palace at Westminster, are bitter to the taste, owing to the change of magnesia into epsom salts, or sulphate of magnesia, by the above-named agent. Such portions as are generally covered with soot and dust, and therefore retain moisture longest, show increased liability to corrosion. Mr. Spiller submitted a plan in 1861, for applying an aqueous solution of superphosphate of lime. The Government has not yet reported upon it. In the meantime, another scheme, particularly applicable to dolomite, has been proposed by him. It consists of the employment of baryta with the hardening salt. It decomposes, in the pores of the stone, sulphate of magnesia, which is very soluble, and substitutes sulphate of baryta, which is very insoluble.

GRANITE A MODIFICATION OF STRATIFIED ROCKS.—Prof. D. T. Ansted, F. R. S., gives a paper in the *Civil Engineer* upon this subject, in which he refers to a section taken by him in the island of Corsica, as proof of his position. He says:

"It has been very common among English geological writers to speak of granites as a primitive rock, as the nucleus of the earth, as having been from time to time erupted and injected, and as having played an important part in that general disturbance of all things by which it is supposed the framework of the earth as a vast skeleton has been constructed. Those who are conversant with the observations made in England by Mr. Sorby, in France by M. Dauhree and others, are aware that all true granite has been elaborated with water under great pressure and at a temperature below melting heat—that, in fact, it has neither been ejected nor has it formed a framework. Those who have followed the march of discovery know that there are granites of all ages, and of many kinds, no two of them being alike. Those who have examined granite for themselves, without allowing themselves to be influenced by preconceived notions of its origin, believe that it is merely a modification of certain stratified rocks under peculiar circumstances and conditions."

Prof. Ansted's conclusions from the section aforesaid are: that granite alternates with and passes into stratified rocks, and must itself be a stratified rock in such cases; that its production does not necessarily involve the destruction and obliteration of all the stratified rocks with which it is associated; and that since all examined granites have been derived from aqueous rocks, or formed with water under pressure, the assumption of eruption of granite is not justifiable in the present state of science.

NEW WINDOWS BEST FOR PHOTOGRAPHERS. Photographers have found that they could take better pictures in a room with new windows, than in one long exposed to sunlight. The explanation of this fact is as follows: A glass containing iron becomes yellowish by exposure; and the transmission of the actinic rays is thereby seriously interfered with. Mr. Gaffield says that a pure glass of light green, or bluish-white color, is the best for photographers. These are the most free from the oxides of iron and manganese; the latter of which he believes to be the cause of nearly all the changes he has noticed. Iron and manganese are to be specially avoided in the manufacture of the better kinds of plate and sheet glass.

DETECTION OF SULPHUR IN PETROLEUM. Dr. Vohl suggests the following plan:—Digest the oil for some hours at a gentle heat with a small piece of sodium. Water being added, the aqueous solution is to be tested with nitro-prusside of sodium. The presence of sulphur is shown by the production of the well known purple coloration.

California Academy of Sciences.

REGULAR MEETING.

MONDAY EVENING, April 20, 1868.

President in the Chair. Some twenty or more new members were proposed.

ACTION ON THE GEOLOGICAL SURVEY.

Dr. A. B. Stout, from the Committee appointed to prepare an expression of the opinion of the Academy with regard to the abrupt termination of the State Geological Survey, submitted a lengthy report. The terms of the Act creating the Survey were recited, and the fact noticed that the manner in which it had been conducted had received the endorsement of five successive Legislatures, as well as of the eminent scientists at the East, who had recommended the appointment of Prof. Whitney. It was set forth that the objections urged against the Survey, arose either from lack of appreciation or misconception of the scope and purpose of the work. The course of the Survey was defined by statute, and the head thereof had faithfully pursued the course so marked out. The reports already published were in accordance with statute requirements, and were valuable contributions to science. The work of the Survey was briefly recited, and the action of the Legislature in abruptly terminating the same was characterized as unworthy of the State, and calculated to excite regret and reproach among scientific men everywhere. The report concluded with a resolution of regret at the discontinuance of the Survey, and an assurance that the Academy holds in high esteem the character of the late State Geologist, as a scientist, and as a man.

Remarks were made by several of the members endorsing the tenor and spirit of the report, which was finally accepted and approved, and the Committee continued, with the view of their being able to suggest some practical plan for aiding the Governor in saving as much as possible of the results of the Survey, as well as to do what they may be able to accomplish in continuing to completion such portions of the work as are already far advanced in that direction.

Prof. Whitney said he desired to mention a fact not generally known in connection with the late survey. From the inception of that undertaking he had asked every succeeding session of the Legislature for permission to publish the results of the survey in a popular form, or to furnish occasional statements of the most interesting discoveries and results to the newspapers for publication free of expense to the State; but his request had in every instance been denied, legislators appearing to think it best to wait reports in full. It is useless, therefore, to urge now that he wished to monopolize the information and objects gathered. He thought it was as well that the Academy should know that the survey had been stopped, not because too little, but because too much had been accomplished. He believed that the survey never would be finished until a man could be found who was capable of subserving private interests, and at the same time satisfying the public at large; and he did not think such a man could be found.

BUILDING SITE FOR THE ACADEMY.

The Committee on location of site for a future Academy building and grounds reported progress. There is a probability that a piece of land will be reserved for the Academy on the Pueblo tract by the Supervisors. Dr. Beverly Cole had been deputed by the Board to confer with the President of the Academy and the Building Committee on the selection of a suitable site, and by the next semi-monthly meeting the matter will probably be determined.

MISCELLANEOUS.

The receipt of a number of new publications was acknowledged. Mr. Bosqui, on behalf of Dr. Geo. Woods, of the U. S. ship Pensacola, presented to the Academy some curious Indian relics from the Presidio of Mazatlan; a large specimen of crystallized salt from Carmen Island, and several barnacles of uncommon size taken from an iron hulk in the harbor of Callao. Mr. B. also exhibited a specimen of the *Gilbertia Palmella*, or *Gastonia*—an East Indian plant, (analogous to our spikenard) raised by him in his garden in this city.

RESIGNATION OF PRESIDENT WHITNEY.

Prof. Whitney tendered his resignation of the Presidency of the Academy in a short address, in which he announced his intention of leaving the State before the next meeting, for a period of indefinite duration, although he trusted that it would not be forever. He alluded to his seven years' sojourn here as one not altogether unattended with pleasure or profit, although these years had been anxious and laborious ones.

He believed the pleasant reminiscences would outweigh the disagreeable ones. He had faithfully devoted himself to the duties of his office, and had contributed from his own resources for carrying out the survey as abundantly as he was able. He made honorable and feeling mention of his co-laborers in the great work, and hoped the same might soon be taken up again and carried to completion.

In the immediate future his residence would be at Cambridge, Mass., where he would be connected with the department of Mining and Practical Geology, which has already been organized under his supervision. He trusted that the five volumes of the Survey now in a good state of forwardness, would soon be completed—it would be an act of "wilful stupidity" not to allow them to appear, since the amount which would be realized from their sale would more than reimburse the additional expense of their publication, which would hereafter be incurred. The Professor concluded his remarks as follows:

Hoping, then, gentlemen, to have the pleasure of meeting you here at no very distant period, and of finding this institution in a healthy state of progress; returning my thanks for the courtesy with which our work, and I myself, personally, have always been treated by you, I respectfully take my leave of this Chair, and the honorable body in obedience to whose wishes I have occupied it.

After an appropriate expression from the Society, Professor Whitney announced that the election of a President would form part of the business of the next meeting, to be held on the first Monday in May.

PLATE PRESENTATION.—One of those incidents which it is always interesting to record, as indicative of the good feeling which should always be maintained between the employer and employed, occurred at the Miners' Foundry, in this city, on Tuesday afternoon last. One of the partners in that well known firm, Mr. E. T. King, has recently severed his connection with his associates and left for New York on the steamer of Wednesday. Previous to his departure the employes, desirous of giving some evidence of the esteem in which he had been held by them during his long term of eight years' connection with the firm, procured an elegant tea service of silver plate for presentation to him. At about 4 o'clock on the afternoon above mentioned, the works were stopped, and the employes hastily collected in the large pattern-room to the number of some 75 or 100, one of their number having been deputized to devise some plea for securing the presence of Mr. King at the same time and place.

The company having been thus collected, Mr. John Chipchase, in behalf of his fellow workmen, drew aside the folds of the National flag, which was spread out on a table before the company, displaying the elegant present to the view of all, and addressed Mr. King as follows:

MR. KING.—*Dear Sir:*—The employes of the Miners' Foundry, having heard that you were retiring from the firm and taking a journey East, could not let the opportunity pass without making a public manifestation of the high esteem in which you are held by the workmen in your employ. To this end we have freely and voluntarily contributed to the purchase of this silver service as an appropriate present.

Accept, dear sir, this small token of our regard for you, as a foreman and a gentleman, and rest assured that you carry with you our sincere love and regard, with our earnest wishes of long life for you and your estimable family, to enjoy the proud satisfaction of having the confidence and friendship of your fellow men.

Mr. King was, of course, taken entirely by surprise, but returned, in a few words, his warmest thanks to the generous donors for their elegant and costly present. The service was manufactured by Tucker & Co., and consisted of eight pieces, including the salver, each piece bearing the following inscription:—"Presented to Erwin T. King, by the employes of the Miners' Foundry, S. F., Cal., April 21st, 1868."

VISITORS in the city should not forget to call at the Spectacle Emporium, 205 Montgomery street. C. Muller, Optician.

[Written for the Mining and Scientific Press.]

Danford's Generator.

EDITORS PRESS:—It is now several years since I cut from a paper an article on "Danford's Steam Generator," in which I am glad to see by your article of March 7th, I was mistaken; for I have long been convinced that the principle is a good one. The idea itself is not new. More than twenty years ago I read in a book entitled, I think, "Anecdotes of the Steam Engine," an account of an invention, the object of which was, to generate steam, only as it was required for use. The steam was produced by the dropping of water upon heated plates of metal; and I think it was condensed and used again. I was quite a boy at that time, and do not now remember the reason of the non-success of the invention, of which I have always retained a favorable opinion. Probably one difficulty was the well known one in the use of superheated steam, or very hot air, viz:—the burning out of packing and of lubricant.

If this obstacle has been overcome as stated, a valuable advantage has been attained, both as to the use of air and steam; for it is well known that the work obtainable from a heated elastic fluid, is greater as the initial heat of the fluid is higher; and some have thought that air would, for this reason, supersede steam as a motor, as it can be used at much higher temperature with safety. The last remark, however, applies to *saturated* steam; and if it is true, as thought by Danford, that there is a limit to the expansion of a given quantity of water, by heat, this advantage of air over steam no longer exists. I cannot, however, agree with you in your remarks on hot air as a motor. Why is the lightness of air an obstacle to its use?

The difficulty experienced by Ericsson has been ascribed to the fact, that air contained in a vessel cannot be quickly or readily heated by fire applied externally, and was obviated by Roper, though in a rather bungling manner, by burning his fuel *inside* the generator. This would seem to be the right principle, though the idea of an engine having to *stopto eat*, as Roper's does, is of course inadmissible. The fuel must be introduced continuously, and combustion should be *perfect*. Carbonic oxide, hydrogen, hydro-carbon, or a mixture of all, as in Siemen's gas furnace, appear suitable for the purpose, and the idea is being worked up in this form in England. Water also might be introduced, as in Danford's Generator, and thus superheated steam would be added to the hot air and gases, in an economical manner.

I hope some inventor will give us a good air engine, for use in places where water is scarce, as in the Cerro Gordo mines.

I will engage to provide a way to extract the silver from our ores with *very little* water, if some one else will produce the power to crush them without any. Such a power is also required to drive the blast for smelting furnaces. C. H. AARON.

Lone Pine, March 26th, 1868.

FIRM CHANGE.—It will be seen by reference to our advertising columns that the firm name of the Miners' Foundry, in this city, which has been retained without any change in name or person for eight years, has now been changed from "Howland, Angell & King," to "Howland, Angell & Co."—Mr. King having sold out his interest to his partners. Mr. K. left for the East on the steamer of Wednesday last. We are pleased to learn that his stay East will be only temporary, and that he prefers to return and make California his future home.

REPEAL OF THE BULLION TAX.—The Superintendent of the Branch Mint in this city has been officially notified that "a recent Act of Congress exempts all bullion from revenue tax, assayed since April 1st, instant." This will be good news for the miners; giving them, of course, one-half of one per cent. more for their dust than they have been heretofore getting. It will be likely, too, to increase the yield of treasure;—at least of the amount which finds its way to the assayers.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

75,248.—**GUN-LOCK.**—John Franklin Crabtree and William Newton Crabtree, Visalia, Cal.

We claim, 1. The pawl-piece B, in combination with the trigger E and the lever F, acted upon by the main-spring G.

2. The spring-catch I, in combination with the lever M, with the inclined oblong slot O, for the purposes described and in a manner substantially as set forth.

75,249.—**DEVICE FOR RAISING AND LOWERING WINDOW SASH.**—John D. Cramer, San Francisco, Cal.

I claim the combination and arrangement of the several parts of my device, namely, the recess A, with the slotted plate B and the plate D, connected to the staff C by the curved piece c, substantially as described.

75,310.—**STEAM-PLow AND CULTIVATOR.**—Philander H. Standish, Martinez, Cal., assignor to himself and Oliver C. Coffin.

I claim 1. A steam-plow, having the rotary knives *i i* operating in a horizontal plane and transversely to the travel of the machine, and the supporting arms *k k*, or their equivalents, together with the vertical shafts *h*, the whole constructed and operating substantially as herein described.

2. The moveable frame U and the arms *a a*, together with the chains V and capstane W for raising and depressing the plows, substantially as herein described.

3. Operating the plows, when moving in a horizontal plane, directly from the engine by the belt b, or an equivalent device, substantially as described.

This invention has already been fully described in our columns.

75,656.—**IMPROVEMENT IN THE MANUFACTURE OF CRUSHED SUGAR.**—C. Spreckles, San Francisco, Cal.

I claim the manufacture of crushed sugar of commerce directly from the centrifugal machine, in the manner substantially as described.

The object of this invention or process is to manufacture crushed sugar directly from the centrifugal machine, as above claimed, without the tedious delay in the method now employed, to wit, that of turning the melted sugar into molds, and allowing it to refine and drain before it can be crushed into the sufficient-sized lumps or pieces of commerce; this process requiring from ten to fourteen days; while, by the improved process, only about *three* days' time is required, and a sugar is furnished of a quality equally as good, and at an expense of at least one cent per pound less.

RECENT INVENTIONS.

PETERSEN'S IMPROVED BLACKSMITH'S HAMMER.—An exchange says that "Mr. Petersen, of Antioch, has perfected a piece of mechanism which is likely to prove of great utility to blacksmiths. It consists of a heavy hammer so hung with levers and springs, and worked with a foot-treadle, that the smith can do any kind of heavy forging without the help of a 'striker.' The machine can be constructed at a cost of \$75 to \$100, and has been perfected after a course of much study and experiment by the inventor." Application for the above machines has been made through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

MCCOY'S GATE SPRING.—Mr. George McCoy, a resident of Antioch, has invented a gate spring, which, by a simple movement of the band, is quickly operated. The gate can also be easily opened or shut by a person on horseback. A patent has been issued for this invention.

HENDY'S SAWMILL.—Three of Hendy's Improved Circular Sawmills have been ordered from the Union Foundry to go on the line of the Central Pacific Railroad. They will be employed in sawing lumber for use upon that road. Two of these mills have the gang circular saws attached. The latter have perpendicular and horizontal saws running at the same time, and cut the timber into "dimension lumber" at one motion; thereby not only securing regularity in the size of each lumber, but accomplishing the work with the utmost rapidity.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Markleeville *Miner*, March 14th: The parties owning the Merrimac claim have recently incorporated under the laws of New York.

The Herculeum claim on the Hercules lode has been relocated this week by Messrs. John Dardis, C. W. Dake, H. H. Dake, W. H. Seaman and B. Mullan.

The tunnel running for the south extension of the Tarshish is encountering more and more of the real sulphuret ore of that deposit.

April 11th: The rock in the Mt. Bullion tunnel is getting softer, so much so that we understand J. Soper and partner on last night's shift made three feet of tunnel.

The lateral tunnel of M. C. M. Co. struck through a clay wall one day this week, and into an ore-bearing quartz of considerable promise. They are now several feet into this ore, and will have it tested soon for its value.

County Recorder Jones has put a man at work in the tunnel to be run for the Michigan extensions on the three lodes known as the Comet, the Oso and the Indian Chief. The tunnel starts in just above the Hooker cabin, on the Mogul road.

Amador County.

Jackson *Ledger*, April 18th: In the B. B. M. Co.'s mine, some 30 ft. or more have been drifted from the shaft, cutting two stratas of gravel. The highest layer has just been struck, and its width is not yet known. It is divided from the lower or bed-rock layer by a hard strata of "tufa" or "marle." The trustees of this company had a meeting last Wednesday and levied another assessment of \$5 to the share.

Calaveras County.

Chronicle, April 18th: The hoisting works on the Petticoat mine at Railroad Flat were ready to commence operations on Saturday last. The rock taken from the shaft prospects well from the surface down. A large mill will be erected during the coming summer.

The late storm caused considerable damage to the Water Co.'s ditch.

The Golden Gate Co. will immediately erect more extensive machinery on their claim. As soon as practicable the Co. will have in operation machinery for crushing the cement as it is taken out, and also of efficient capability to keep the water under subjection.

A large stream of water, some 30 inches, was struck in the tunnel of Norton & Co., in Old Rich Gulch, on Saturday last. It flowed out from a fissure in the otherwise solid bed-rock. Its volume was so great that although quite a ditch had been dug in the bottom of the tunnel, the boards laid down to walk upon were floated away. Norton & Co. are pushing forward, and expect to reach the lead next week. Their tunnel has been driven 300 ft.

We have been shown some quartz specimens taken from a newly discovered lead on French Hill, which eclipse anything in that line we have seen for a long time. But little work has yet been done on the lead. Some Mexicans were the discoverers.

Bill Lunt found a chunk of pure gold in his claim on Red Hill, Rich Gulch Flat, one day this week, valued at \$85. There have been several large pieces found in the vicinity of this claim.

Homer, Hill & Co. have purchased the engine and machinery of the Mina Rica quartz mill at West Point, and are now engaged moving and erecting it on their claim in China Gulch.

The Whisky Slide correspondent writes: Our mining interests go smoothly and "pavily" along, as usual. During last week, Collins & Co. of Chee Chee Flat, cleaned up the sum of \$1,500, the result of a forty days' run for three men; an average of \$12.50 a day to the hand. Many claims in this neighborhood are paying well, but are subject to the almost nightly visits of sluice robbers, so that the miners scarcely know what they are making, and if they happen to pick up a nugget, or strike an unusually rich place, they say nothing about it, for fear of being robbed.

San Andreas *Register*, April 18th: The prospects for a busy season in this mining district are very flattering. Mr. Irvine's deep placer claim is now a fixed fact, and will furnish a number of miners with remunerative employment while the water lasts this summer.

Mr. Thorn's quartz claim is being worked, and will be steadily and thoroughly worked during the coming summer. Major Gorman and Capt. Thorpe are making all the

necessary preparations for work on their quartz lodes this summer.

The miners in Washington district are commencing work. C. V. McNair is at work getting the arastra of the Washington mining claim in order for crushing; and that Co. will soon be engaged in crushing the exceedingly rich ore from their lode. Mr. William Smith is taking out wonderfully rich quartz, and sending it to be crushed by Wood's arastras, on the San Antonio Creek. Prospecting is beginning in earnest, and all who have claims are placing shafts, drifts, cabins, etc., in order for a good summer's work.

Kern County.

Havilah *Courier*, April 11th: Sageland, the center of the New El Dorado mining district, is one of the liveliest camps in the county.

Mono County.

Gold Hill *News*, April 16th: At the office of Dr. Ellis, in this town, yesterday, we were shown a box full of rich ore from the Arctic mine, Mono County, California, on the headwaters of Walker river, some 70 miles from Carson City. The ore is a very rich character of argenteiferous galena, similar to the ores of the New Truckee District. Some of it will yield 70 per cent. of pure metal, lead predominating, yet assaying very richly in silver. The quantity of ore we saw would yield 60 per cent. of metal. The ledge, so far as developed, is about four feet in width, and from the surface to about 15 ft. in depth, some 40 tons of this same rich character of ore has been extracted. The mine is not being vigorously worked at present, but during the coming season rich and very valuable developments are expected from it.

Nevada County.

Daily Transcript, April 15th: Hydraulic mining in this county is not declining by any means. During the past two years a number of new mines of this character have been opened, and a large amount of prospecting is being done. As a general thing these mines are very extensive, requiring a large quantity of water. There are other claims in which operations have been suspended on account of a small loss, and these may be again worked. There are quite a number of miners in the county who own small claims, which, with low rates for water, can be made to pay wages, and many of these since the reduction in water rates by the South Yuba Canal and Water Co., will now be worked.

April 18th: The hydraulic claims at North Bloomfield are commencing work. Mr. R. C. Black has two sets of claims in operation, and the North Bloomfield Gravel Co. is working in three different places.

Nearly all the companies at Moore's Flat are now engaged in mining. They have abundance of water and a fine prospect of "big pay" for the coming season.

April 22d: Since the strike by the Welsh Co. at Relief Hill, the miners in that locality have been greatly encouraged. The channel struck by this company is supposed to be a continuation of that worked by the Union Co. on account of the similarity of the gold and nature of the deposits. The Eagle, Welsh, Union, What Cheer, and North Star companies, are now washing. The Union Co. cleaned up \$3,400 last week. This is the ground in which the tremendous blast of 450 kegs of powder was discharged last fall. The North Star Co. last week discharged a blast of 200 kegs of powder, which loosened up an immense body of dirt. Besides the operations of these companies, a large amount of prospecting is being done in the vicinity.

The Snap Co., at Eureka, struck a splendid ledge last week. The point where the ledge was tapped was 200 ft. below the surface, and gold could be seen in nearly every piece of rock taken out.

Nearly all the hydraulic mining companies in Little York township are now at work. At You Bet nine companies are washing, with excellent prospects. The cement mines are also yielding good returns. The Brown Bros. have struck richer cement than they have ever had before. From their claim \$3,000 were taken out last week. Neece & West are averaging about \$1,500 per week, and Hydelliff has struck first-rate cement. The Chalk Bluff Gravel Mining Co. is doing well. They have struck a fine bed of gravel, containing coarse gold, and expect to take out a large amount of dust during the season. All through Little York township the miners are prepared for work, and have every prospect for a prosperous season.

Mr. Nichols of Columbia Hill, recently purchased a set of mining claims from Mr. Jones, at Grizzly Hill, for \$17,000.

Mr. Stede, the original locator of the Mohawk ledge, has struck a 4-ft. ledge about a mile from town and east of the Grass Valley road. The ledge has a first rate appear-

ance and the rock looks as though it would pay well.

Gazette, April 15th: The entire gravel range extending from a point near Gregory & Co's sawmill to Quaker Hill, a distance of 14,000 ft., has recently been surveyed and located in claims for mining purposes. Some of the locations made on this strip or range have a width of 2,000 ft. Miners have commenced prospecting at different places by sinking shafts. If good prospects are obtained, it is probable that a ditch will be constructed from the Cascades to the Crystal Spring House, on the Red Dog road, to supply the miners with water.

April 18th: The Portuguese Co. at Kentucky Flat, under the management of Frank Phillip, have again struck a rich deposit of coarse gold in their claims, some pieces weighing as high as \$10.

One of the proprietors of the Rising Star ledge has made a bet of \$100 that the rock of the ledge now being worked at the Cornish mill will yield an average of \$75 to the ton.

The South Yuba ditch at Scotch Flat has been repaired and water turned on. The following companies will resume work this week: Creamer Co., South Yuba Co., Jensen & Co., Houston & Co.; the Bean Co. have completed their tunnel and will commence running next week. The prospects for a large yield are very favorable.

April 22d: The claims about North Bloomfield promise exceedingly well, and the miners at Alpha are expecting a prosperous season.

Grass Valley *National*, April 17th: N. K. Lamson has leased the old Coe mine, and last Saturday started an 8-in. pump which soon relieved it of water.

A few days since, C. P. Bush & Co. struck the ledge, in an old shaft and drifted 35 ft. on the ledge. They took out 17½ tons of rock which they had crushed by the Hitchen Bros., at the Larimer mill. The yield was \$508.62.

April 18th: An interest in the well known and rich gravel claims (the Town Talk) is offered for sale. These claims have never called for an assessment and have paid as high as \$15,000 per week.

Grass Valley *Union*, April 15th: The two-thirds interest in the Union Hill mine, of this place, was sold a few days since for the sum of \$60,000. The purchasers reside in San Francisco.

In the drift now being worked in the Idaho mine, the ledge is four ft. wide, and the rock shows handsomely in free gold.

Placer County.

Dutch Flat *Enquirer*, April 18th: On Saturday last about the same minute two large caves occurred, one in the Waukegan and the other in the Washington claim, both on the west side of town. The cave in the Waukegan smashed down things generally, doing much damage and causing a delay in the active operations of the mine of some days. In the Washington about 50 tons of dirt falling from the banks filled up the sluices, smashed the pipes, pipe-horses and tools, etc., to such an extent as to necessitate a new rig throughout.

We learn that the shaft sunk by the Dutch Flat Co. reached the bedrock on Saturday last without having struck blue gravel, for which they were sinking.

Plumas County.

Quincy *National*, April 11th: The Taylorville correspondent writes:—A miner by the name of Johnson has found a rich quartz ledge near the old Light ranch in Indian Valley. The Crescent mills are not running; want of wood is the reason.

April 18th: Knisely & Co. are pounding away at the quartz with their little four-stamp mill, and, judging from a partial clean-up, made a short time since, their rock is going to pay well.

The Whitney mill is running steadily. The Crescent mill has commenced running again.

Sierra County.

Dowdville *Messenger*, April 18th: A few weeks since, Gus Larrien, while cleaning up at his claim in Slate Castle Canon, came across a piece containing \$148.

The Docile mill has been stopped and will not commence crushing until the claim is more fully opened and rock easier to be got. It paid well to the last.

The bed-rock tunnel of Cox & Co., at Scales Diggings, is progressing finely.

The Port Wine correspondent writes: The Golden Gate has struck good pay, turning out gold at the rate of \$6 to the car load, and the Monte Cristo took out in two weeks \$2,800.

Siskiyou County.

Yreka *Union*, April 11th: A Scott Bar correspondent writes: Ryan & Williams, on Quartz Hill, are taking out the precious stuff by the pound. The Big Flat Co. has its claim in fine working order, and meets with more than ordinary success in work-

ing the old river channel; last week one cut, four by nine ft., paying as high as \$500. Pullen & Co. are hard at work opening a hydraulic claim on Graveyard Hill. China Louis and his gang, on Poor Man's Bar, are busy, and, it is surmised, will take out large quantities as soon as they get on the bed-rock. The Magoffey Brothers have been prospecting for a big thing, about two miles above the lower ferry; but, failing to strike it, gave it up in disgust. Squire Easton has entered upon an extensive mining operation on Mill Creek. The excavation of Malthy & Co.'s new ditch, from the Fourth-of-July Creek to Lydel's Flat, is nearly completed.

It is contemplated to raise a company to prospect, by means of a tunnel or tunnels, the ridge that divides the Yreka Flats, Greenhorn, Cherry, Deadwood, and Indian Creeks, from Humbug Creek.

Tulare County.

Visalia *Delta*, April 15th: John D. Carter, Superintendent of the Philadelphia Co.'s mines, located at White River, in this county, returned last week from a trip to the East on business of the Co. Mr. Carter informs us that he intends to commence operations immediately and prosecute the work with vigor, having made extensive arrangements for that purpose. From what we know of these mines we expect to hear of a large yield pretty soon.

Tuolumne County.

Sonora *Democrat*, April 18th: The Tuolumne Water Co. have decided to take water to Chinese Camp.

Mr. D. J. Hurley recently showed me some very rich quartz from the "Sultan" mine, at Springfield. Mr. Richards showed us a fine "prospect" from his tunnel claim in Table Mountain. He says but little work can be done at present on account of water.

A correspondent writing from Chinese Camp, says: There are excellent and extensive diggings in our vicinity, but owing to the peculiar character of the country we have been unable to have water brought upon them, and carting the dirt has been our only method of working them. These diggings lie in the flats and gulches around Chinese Camp, and are separated from the ditch district, by isolated hills and deep gullies; hence the necessity of pipe through which to carry the water.

About ten days since there was some remarkably rich diggings struck below here, about 10 miles from Ballard's ranch. The fortunate discoverer, Judge King, has spent a great deal of time prospecting for quartz in that vicinity. The pocket (for such it is) is about 100 yards from the bed of the creek, and was found by the dirt being washed away by the rush of water from an overflowing ditch. The earth is about three ft. in depth, the pay dirt being a tough grayish quartz clay, thickly epangled with fine gold, paying from \$15 to \$30 to the pan. It has to be dried and pounded before it can be washed.

Yuba County.

Marysville *Appeal*, April 10th: We are informed that the work will be commenced on the Bateman ledge in due course of time.

April 15th: Articles of incorporation have been filed in the Secretary of State's office in behalf of the Smartsville Consolidated Hydraulic Co., which proposes the conducting of mining on claims or lot of mining ground in the Sucker Flat and Empire mining districts, Rose Bar township.

ARIZONA.

Prescott *Miner*, March 21st: The Eugenie lode in Big Bend district, in some places is over 10 ft. wide, all solid quartz and sulphurets. On the Galena mine, same district, a shaft is down 100 ft., we visited the mine and was lowered down 60 ft. to where a drift has been run upon the ledge a distance of 20 ft., and we were more surprised than ever at beholding a solid, well-defined ledge of quartz and sulphurets six ft. in thickness, with nice, smooth case-walls of talcose slate. The sulphurets in this mine resemble those found in the Sterling lode, and small lots of them, worked in San Francisco, have yielded from \$300 to \$400 to the ton. There are three shafts upon this mine. For richness of its rock, evenness in width of vein, and perpendicularity and beauty of case-walls, the Galena lode beats any other we have seen in a long time. . . . John A. Rush is hard at work on the Dividend mine, assorting and hauling rock to the mill. . . . The placer miners at work in the district were doing very well. Lewis & Thomas have the richest and best placer claims there.

Smith & Berry are sinking a shaft on their lode. The rock is very rich.

The shaft on the Chase lode, Hassayampa district, is now down 75 ft. The vein is six ft. wide, and the rock is very rich. Mr. Curtis showed us some pieces of the rock, the other day, which contain a great deal of gold.

Frank Alters and F. Hammond have been engaged in sluicing decomposed matter out of the Chloride lode. In one day's run they took out \$27.

The Colorado Co. are doing well. Jim Anderson, Tom McWilliams and Chris. Bentle are working a bar on the creek, below Kirkland's arastras. The bar was ground-sluiced by the winter floods, which left about three ft. of dirt on it, that pays, from top to bottom about three cents to the pan.

The England Gulch, near Prescott, continues to pay fair wages.

Two or three water-wheels are now running in Walker's district, and considerable rock is being crushed.

The placer miners are making \$6 and \$8 a day.

Little & Taylor at Lower Lynx Creek, are pipping away.

Some ten or a dozen Mexican miners came into town from the diggings this week, and from the manner in which they flung their gold dust around, we take it they have been doing extremely well.

Manasseh and Griffin, who arrived here from Wickenburg on Thursday evening, state that both mills are grinding away, night and day. The Wickenburg 5-stamp mill was clearing about \$1,000 per week.

Messrs. Graves and Cook are about to erect a desulphurizer in this town, which they think will work sulphurets well.

March 28th: There are about 50 men mining at Weaver. All are doing well.

Some of the soldiers stationed at Camp Whipple, while prospecting in Granite Creek, recently, between Sheldon's old ranch and the post, found a place where they can go and pan out a few dollars. Recently, in one day, a soldier panned out \$60. Some good pieces have been found.

Pieces of gold, weighing from \$3 to \$40, were found in the England Gulch this week.

Same, April 4th: The run and clean up lately made at the Ticonderoga mill, in Big Bug district, on Dividend rock, by Bowers & Rush, gave entire satisfaction.

The Badger lode, in same district, is being worked and yields good rock.

Noyes & Curtis' mill is being set up at the Chase lode, Hassayampa district. The shaft on the lode is now down 100 ft. ledge fully six ft. in width, with between three and four ft. of very rich rock.

Both the Wickenburg and Vulture mills are running with splendid success.

The placer miners in the various districts are doing first rate.

The San Diego correspondent writes to the *Times* of this city concerning the Arizona mines, as follows: The mining news from Arizona is highly favorable. The Vulture is turning out very large dividends to its owners. The Sterling is also being successfully worked by the Reid process. The Bully Bueno and several other ledges, are also paying well, according to last reliable accounts. The E. W. Morse gold and silver mine, down in Lower California, is said to be turning out far better than was ever expected by the most sanguine gold hunters. The ore taken from this mine is said to assay, on the average, \$200 to the ton.

COLORADO.

Central City Register, March 26th: The Clark-Gardner Co. are fixing to obtain fine results from their mines. . . . Mr. Fitzpatrick has started his mill on ore from the Burroughs, in the interest of J. A. Conlee. . . . Mr. A. N. Rogers, having rented the old Kip & Buell mill, is tearing out the old batteries and ereens, and putting in entirely new housings, screens, shoes and dies. When done the concern will be put to work on ore from the Bohtail. . . . The Canandaigua lode is being worked by Moores & Myers. The shaft is still in what is known as surface quartz, and crushed by Ed. Moores in his stamp mill yields \$200 per cord. . . . The Ophir mine turned out 130 ounces of gold last week from second quality ore. . . . The Gaston lode, Russell's Gulch, is being reopened by Messrs. Cushman, Emanuel and others. . . . The Lexington mill is to start up this week under the direction of Mr. Moses Hall. It is for custom business exclusively, has 24 stamps, plenty of water, and quartz promised. . . . James Clark is refitting the La Crosse G. M. Co.'s mill in Nevada, with the intention of grinding custom quartz. This concern will commence work about the first of next week. . . . Peregrine's mill is crushing from the Running lode, and doing well. . . . Reports say the bar mine on Clear Creek are doing very finely.

Same of April 2d: Messrs. Buddee and Chatfield are mining on the Seudeburg lode. They are down 40 ft., and are taking out ore from a two foot crevice, which being crushed at Mansur's mill, Nevada, yields from \$110 to \$160 to the cord. . . . Messrs. Cassler & Remeck are fitting up the New

Bedford mill, and will have it ready to run in a week. They use the Australian float instead of the screen. . . . J. A. Conlee is running 60 stamps. He is now timbering the Kansas. . . . Messrs. Harvey & Frazier have leased numbers 13 and 14 on the Gregory, owned by the Rocky Mountain Co. . . . A man named Hunter has struck a rich pocket on the bed-rock below Idaho, and has been panning out \$3 to the pan. . . . The batteries of the Chicago mill having been worn through, have been torn out and new ones are being put in. The mill is to be thoroughly repaired. It is to be run on custom work. . . . James Miller has been building a new mill above Chase Gulch on North Clear Creek. He will have it ready to run the latter part of next week. . . . Siegel, a Frenchman, is working over the dirt once worked on Chicago Creek, and is, after carrying the dirt 300 ft., taking out an ounce a day. A young man just above Idaho is working alone, and is taking out half an ounce a day. Two nuggets were recently taken out just above Idaho, one of which weighed 17 pwts., and the other 22.

Georgetown Miner, March 26th: More mining is being done on Brown Mountain and that immediate vicinity, at present, than in any other part of this district. . . . Mr. Foster made an assay, last Tuesday, of some stephanite, brittle silver ore, from the Munsell lode, that gave \$13,200 in silver to the ton. . . . J. W. McFarland has struck a four-inch vein of argentiferous galena and sulphuret of silver ore, carrying blue and green carbonates of copper, in the Winnebago lode, situated on Leavenworth Mountain. . . . An assay of a specimen of copper ore from Sugar Loaf district, Boulder county, gave a return of 1,412 lbs. of copper to the ton of ore.

Denver News, March 25th: At the United States Branch Mint this morning were two bars of gold bullion, valued at \$1,221 38 in coin.

The decided activity shown among the miners of Gilpin county is most encouraging, and gives promise of a season of great prosperity. All the old mills which have stood idle for years are again pounding away on the ore which is being taken from lodes which have not been worked since 1863-64.

DACOTAH.

Sweetwater Mines, April 1st: Among the new discoveries recently made, mention is made of the Gloria Mundi ledge, situated in the Kentucky district, and the Atlantic Cable ledge, situated in Shoshone district; both of which are represented as giving surface indications of remarkable richness. They each crop out boldly for a long distance and present well defined wall rocks.

The Helena (Montana) Herald of March 16th, says of the Sweetwater mines: The facts are simply, that there are no such mines as "Sweetwater Mines," save in the imagination; and all these grand fictitious projects gotten up at a distance in connection with anything of the sort, prove, so far as we can learn, to be nothing less than downright swindles, or the most audacious attempt to entrap the pilgrim army of this season into a snare, from which they cannot extricate themselves short of the sacrifice of their last dollar and their outfits. Even though the Pacific railway should, on its nearing the main range, start a lively burg at or near South Pass, that will be a year hence, and we predict for every thousand persons who rush to those dens of robbery, dissipation and crime, there will be 999 go away beggars where one of them makes a stake.

But again, and finally, we say that so far as the "Sweetwater Mines" are concerned, we denounce them, upon all the evidence before us, (although willing, as we ever have been, to give every region and camp its real dues,) as a second Salmon River sell, only worse, if such a thing could be. That there will be found, eventually, in the Sweetwater and South Pass country along the main range, valuable mineral fields, we have no doubt whatever. In fact, it is almost certain that such will be the case; but that there is at this time any such place as "South Pass City," or any such mines as "Sweetwater Mines" that should induce men to rush blindly there with hopes of gain, we declare to be false.

IDAHO.

Lewiston Journal, March 21st: There will be six arastras to work at Florence this spring.

A correspondent writes from Warren's Camp as follows concerning the Hic Jacet mill: "We opened the battery to-day and took out 140 ozs. of amalgam; we did not clean up, as we have 20 tons more of the same ore to reduce. This is gold from 15 tons of our silver ore; the tailings will yield on an average \$200 to the ton in silver. We

are concentrating the sulphurets on blankets, so as to bring them up to about \$5,000 per ton. We have engaged about 200 tons of ore to crush, which they are now hauling to the mill; we are working night and day."

The Williams and Maxwell mill will be ready to start about the 1st of April.

The same paper of March 28th, gives the following from Warren's Camp: Five new quartz lodes have been discovered and recorded—amongst which are the Oasis and the Paymaster, and are estimated to be good ledges. The owners of the Davis lead, at Florence, have visited Warren's to examine the *modus operandi* of the mills there, in view of the purchase of one for their ledge.

The Hic Jacet mill at Warren's is running in good shape—crushed in all 112 tons of ore—the last 12 tons yielded \$86 per ton. The ore was unsorted and from the Scott lode. They are now at work upon the ore from the W. B. Knott, with 20 tons on hand to crush.

Owyhee Avalanche, April 11th: P. H. Clark has sold out his interest in the Pauper mine to J. M. McQuaid for \$3,000, and has purchased a controlling interest, 650 ft., in the Mississippi claim, including the Donovan & Thomas, for \$5,500. The Mississippi is considered a very promising mine.

The Lewiston correspondent of the Portland Oregonian, of April 10th, says concerning the Warrens diggings:

At present the Winfield Scott is the favorite ledge of the camp, having yielded nearly \$200 per ton free gold, as worked by the Pioneer mill; it is also rich in sulphurets of silver. Three companies are now engaged in taking out quartz from this lead.

The W. B. Knott is conveniently located to the Hic Jacet mill, and is about five feet wide, but not well defined. A 30-ft. shaft has been sunk on this ledge and about 100 tons of ore taken out. Very nearly 100 tons of rock have been taken out of the Hic Jacet ledge and worked, the yield of which has been satisfactory.

Messrs. Hanna & Co. have extracted about 75 tons of rock from the Sampson ledge. They have recently had 36 tons of decomposed ore crushed, which was unsorted, and obtained about \$30 per ton. They are satisfied their rock will pay, and so have put on a day and night shift. This company has run a tunnel 150 ft., and are sinking a shaft. The ledge is about 30 in. wide, well defined and rich in sulphurets of silver and free gold.

A shaft is being sunk upon the Washington ledge by the Pioneer Mill Co. They have found the ledge three ft. wide and well defined.

Several new quartz ledges have recently been discovered and recorded, some of which are estimated to be very rich, and parties are continually out prospecting for more. Altogether about 100 ledges have been discovered in Warren's camp.

I learn that rich specimens of cinnabar have recently been found in the sluice boxes of Messrs. Pollok & Co., at Miller's camp, 20 miles from Washington, and that parties intend prospecting for it this spring.

Portland Oregonian, April 14th: Mr. S. M. Gillingham, who spent the last winter at Warren's, and who arrived from there two or three days since, showed us yesterday some beautiful and rich specimens taken from the Winfield Scott, the W. B. Knott, the Hic Jacet and the Sampson ledges of Warren's, and the Davis ledge of Florence. If these specimens represent the average of rock from those ledges, it is not at all surprising that the people up there got excited and have quartz on the brain.

A gentleman who has just returned from a trip through the Shasta and Willow Creek mines, says that owing to the scarcity of water, those mines will yield but little the coming season.

NEVADA.

Esmeralda.

Aurora Union, March 14th: The following is from Pine Grove: At present the Wheeler mine is not being worked, the Co. having just completed a large run. This we presume is only a temporary suspension in order to make arrangements for the spring campaign. Last week the Wilson Co. cleaned up from a run of over 100 tons of sulphuret ore, which yielded \$37 per ton. This Co. commenced this week on what is expected to be a big crushing of surface ore. Workmen are now engaged on the Toombs and Abraham mill.

The Pine Grove correspondent of the Virginia Enterprise of April 19th, says: Last Monday afternoon a vein of fine ore from three to four ft. wide, was struck in the shaft of the Wheeler mine, at a depth of about 10 ft., which will pay at least \$50 per ton, and some of it will go as high as \$300. The vein is well defined and promises a large body of ore. Appearances indicate that there will be two new strikes here within a week or so.

There is some little excitement about town based on the rumor that Wilson is taking out about \$1,000 a day, off of the plates in his mill, which is running night and day from ore in his mine. Another large body of ore has been struck in this mine, which is six ft. in width and of a very high grade.

Billy Bourne has had nearly 100 tons of Midas rock crushed by the Pioneer mill, and has nearly as much more on the dump. The smoke stack of Toombs & Abraham's mill is up and the whole thing is now being inclosed in a frame building.

Enterprise, April 17th: All the mills in Pine Grove are in full operation on paying ore.

Humboldt.

Unionville Register, April 18th: The Pioneer mill commenced crushing rock from the Arizona mine again this week. The mill has been running on tailings for the last three months, the condition of the road being such that no ore could be hauled from the mine. From this time on, the bullion shipment from the mill will be largely increased, as the supply of ore is abundant and the quality excellent. The new mill for this company is going up rapidly, and will be in running order by the first of June. The number of men at work on the mine will soon be largely increased and ore taken out in quantities sufficient to keep both mills running.

Reese River.

Reveille, April 15th: A sale of several mines in Hot Creek district, has recently been made to an Eastern company. The Gazelle and Prometheus ledges are included in the sale.

The mill of the Centenary company will resume operations about the first of May.

In a drift running into the hill from the bottom of the incline of the Buel North Star mine, which is over 500 ft. deep, a large ledge was cut a few days ago.

John Higgins, who recently returned to this city from McCann Creek, Tuscarora district, in the Goose Creek country, does not give a very favorable account of the yield of the placer mines there. After sluicing for a week he found his earnings to be less than a dollar a day, and he concluded that it would not pay to continue the business. But the gold-bearing quartz ledges are still believed to be valuable.

Five bars of bullion from the mill of the Combination Co., were brought to this city by the stage last night.

April 17th: This morning a train of mules arrived at the Manhattan mill in this city, with a load of ore from Hot Creek. It was obtained, we believe, from a new discovery in Rattlesnake Cañon, and is fine looking ore.

The California mill will be opened on "tailings" to-morrow.

Belmont Reporter, April 11th: Gillette & Clarke, at Rattlesnake Cañon, Hot Creek district, are now down only 20 ft. upon the Wyoming, and are producing rock from a vein six feet wide, which assays throughout from \$50 to \$2,900. The new Philadelphia is down 30 ft., and is putting out rock from a heavy ledge which will pay at the rate of \$100 to \$180 per ton. The Wyoma is also getting out good rock. At Morey, which is 15 miles north from Hot Creek, the mines are proving to be good for any amount of ore which will pay \$100 per ton.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia Enterprise, April 15th: The Kentuck Co., Gold Hill, have commenced sinking in their old shaft. They will put it down 400 ft. lower before drifting.

The old St. John's mine, situated north of the Occidental, has already yielded about 2,000 tons of paying ore, which was crushed at the Birdsell mill near Dayton, and during the coming summer will be vigorously worked. It is probably the same lead as that upon which the Occidental mine is located. Several companies are opening mines in the vicinity of the two claims named.

The property of the English Mill and Mining Co., on the Truckee, has changed hands. A new English company are the purchasers.

Gold Hill News, April 13th: Within the last 48 hours the east clay wall of the great Comstock ledge has been cut in both drifts running west from the Imperial-Empire shaft, at the 900 ft. level.

There was shipped from Wells, Fargo & Co.'s Gold Hill office, this morning, 6 bars of bullion, weighing 492 pounds, and of the assayed value of \$13,340 54.

April 14th: There was shipped from Wells, Fargo & Co.'s Gold Hill office, this morning, 16 bars of bullion, weighing 1,155

(Continued on Page 269.)

Saturday Morning, April 25, 1868.

Notices to Correspondents.

TRELAWNEY, Grass Valley.—To Mayow, a native of Cornwall, and highly talented experimenter, we are indebted for many of our most interesting early experiments calculated to elucidate the properties of air. Mayow was the first who conceived that a close affinity existed between combustion and respiration. Some of his experiments have been shown by subsequent observers to be not only very correct, but also of a highly refined character. He first burned a candle under a bell-glass, and found the air so deteriorated as to be unfit for the continuance of combustion. He then confined a mouse in a similar portion of air, where it soon manifested the necessity for a renewed supply of oxygen. He afterwards placed a mouse and a candle under the same bell-glass, on which he found that the mouse could only survive *half* the time that it could if placed alone under the bell-glass. He then reversed the experiment, and endeavored to consume combustible matters that had been deteriorated by breathing, and found that in such circumstances combustible matters would not burn. Examining the residuary air standing over water after combustion, he found that it was lighter than the atmosphere and extinguished flame; thus indicating the presence of what we now denominate azote, or nitrogen. Mayow was born 1645, and died in London, 1679. His latter days, like those of many true geniuses, were passed in comparative obscurity.

DAIRYMAN, Petaluma.—The reason why sweet cream requires less churning than sweet cream mixed with new milk, arises from the circumstance that with cream alone, the absorption of oxygen which takes place in the course of each agitation, is diffused through a much smaller quantity of liquid compared with the proportion of butter contained therein; the lactic acid formed by this absorbed oxygen is consequently more concentrated, and therefore acts with greater energy on the outer coating of the butter globules. The fluid is also less aqueous; the two circumstances combined causes the butter "to come more quickly." Sweet cream in butter-making is rather a relative than an absolute term, for accegency commences, especially in warm weather, within a few hours after milk has been "set to stand."

CANNABIS, San Joaquin.—If not too stiff, a large breadth of your county is well adapted for the growth of hemp. In Europe, hemp, like flax, is not mowed, but pulled, and that can only be done by hand labor. Whether mowing hemp would depreciate its value when manufactured into a commercial form or not, and if so, how much, we have never had the opportunity of learning. Independent of the pulling, the preparation of the gathered straw before it can be made saleable, requires a large amount of labor and special attention. We are afraid this fact will retard the introduction of its cultivation into California.

IBERIA—Calls our attention to an unintentional omission on our part, in neglecting to describe, amongst other mining educational institutions, the fact that a "School of Mines" was established at Madrid, the capital of Spain; that in 1847 an Academy of Sciences was created, and shortly afterwards a commission was appointed by the Spanish Government to construct a geographical and geological map of the province of Madrid.

Kustel and Hofmann's Process of Chlorination of Ores.

In setting forth, in our last issue, the advantages of Messrs. Kustel & Hofmann's process on silver ores, an error occurred relative to the pan-tailings from Reese River. The specimens in question were worked in a pan without roasting, but the resulting tailings, subsequently subjected to the chlorination process, required to be properly roasted before being chloridized.

The chlorination process is not quite so simple and speedy as the pan-amalgamation; but it gives a better result and is less expensive. The complexity of the process, however, is only seemingly so to those who never operated with it before. This is the case with all new manipulations. After one week's operation this process appears simple and easily executed. There is no universal process for silver ores yet discovered; for the chlorination process itself, the nature of the ore must first be considered. But it may be safely conjectured that all ore treatable in barrels will also answer for the chlorination process; giving at the same time in most cases a better result and a purer metal.

It is not necessary that the ore should be very finely pulverized, unless it is very rich. Generally, dry crushing, with a sieve of 40 holes to the running inch, is sufficient. Whether salt should be used, and in what quantity, depends on the quality of the ore. One or two per cent. is usually sufficient. It is charged at the same time with the ore or after a short interval, as the case may require. The roasting is executed in the usual way, commencing with a low heat, and increasing it towards the end of the operation. When finished and cooled down, the ore must be wetted, as is done in the chlorination process with auriferous sulphurets; after this, it is placed in the vats for chlorination. Some kind of ores consume very little chlorine; but it must be produced in such a quantity as to fill up the vacant space in the vat containing the ore. By a simple apparatus the chlorine can be drawn over into another vat charged with ore prepared for chlorination, and the deficiency of gas supplied. The chlorine for this purpose can be kept in a reservoir.

The cover is then taken off and water introduced, by which the chloride of gold is dissolved and carried out into a precipitating vat. If there is copper in the ore, that metal will be dissolved, together with the gold, and precipitated; first, the gold by sulphate of iron—the copper by pieces of old wrought iron.

The chloride of silver which remains in the ore, must be dissolved by hyposulphite of soda, as is done in Patena's process. This salt, dissolved in cold water, is conveyed into the vat and allowed to filter through the mass, whence it flows into the precipitating vat. To hasten the filtration, a very simple, effective arrangement is applied at the bottom of the vat, so that even slimes, if not too tough, can be filtered speedily. This contrivance is very important in case it should be necessary to grind the ore finer on account of its richness, or if pan-tailings are subjected to this process. The filtration requires from eight to twelve hours.

The precipitation of silver from the argentiferous liquor is effected by polysulphide of sodium. Dissolved in water, it is poured into the precipitating vat until all the silver is thrown down as sulphide of silver. The liquid must be kept in motion vigorously, at the same time, in order to promote the clearing and precipitation. Care must be taken not to add more of the precipitant than is required to precipitate the silver. The process of precipitation seems to be complicated; but a workman can do it in fifteen minutes, even if the largest vessels are employed.

The sulphide of sodium, after the precipitation, forms hyposulphite of soda, and

for this reason the first supply of hyposulphite will serve for years as a dissolving agent, the wastage being more than fully replaced by the use of the precipitant.

The precipitated mass of sulphide of silver from the tubs is deposited in bags, like those used for amalgam filtration, pressed, dried, and, after a moderate calcination by which the greatest part of the sulphur is driven out, melted in crucibles with addition of some iron. The iron-matte formed above the metallic silver is skimmed off, some horax added, and the metal poured into molds.

The matte always contains some silver, and for this reason is turned back to the roasting, together with the ore.

Any further explanation with regard to this process can be obtained of Mr. Kustel, 611 Commercial street, (opposite the Mint,) in this city.

Taxing Mining Claims.

There is a disposition in some of the mining counties, on the part of the County Assessors, either upon their own volition or upon advice of County Attorneys, to take the ground that the recent decision of the Supreme Court, requiring that *all property* should be taxed in conformity with the State Constitution, does not include mining property, and that it is no part of their duty to assess such property. Whatever may be said as to the policy of taxing property in mining claims, we think there can be no doubt as to the meaning and intent of the decision referred to; or that, in case the direct issue is made, the parties raising it will be defeated, and thus put to useless expense.

The entire course of legislation and judicial decision in this State has ever recognized and protected a qualified ownership (property) of private individuals in mining claims; and the Supreme Court has now added to its previous recognition of this description of property a direct decision that *all property* must be taxed. It is now more than ten years since the same Court decided, in the case of the State *vs.* Moore, that although the property of the Government in land (in that case not mineral) was exempt from taxation, that exemption did not extend to the interest of a private individual in the same land. The two interests were severable; exemption from taxation was a privilege of the Government,—not an incident to the property. In the face of such a decision there can be no force in the objection that the decision cannot be applied to mineral land, on the ground that the value of land for precious minerals can only be conjectured, while its agricultural value can be readily decided—for there is a universal standard of value in the amount which any such property will bring at public sale.

In view of these facts, but without admitting the policy of such decisions, we think it will be useless for the miners to ignore the situation, and preposterous for the assessors to refuse to list any private interests which they may find in the mineral lands "according to their value." If continued exemption in this particular is to be sought for, we must go elsewhere than into the State Courts, for redress. We do not and never did believe in taxing the mines. We have ever held that every possible encouragement should be extended for their development and proper working. With the exception of now and then a notable instance of success, there is no branch of industry in the country which yields such small returns for labor as mining; and were it not for the fascination which clings around it—the constant hope of doing better, of making a "strike"—a large majority of the entire mining population of this coast would quit the business at once and seek some other, more reliable and better paying employment.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

Our Manufacturing Industries.

The manufacturing interests of California are rapidly assuming a large importance; fresh branches of industry are springing up in every direction, with a rapidity of succession which would do credit to even many of the older and more densely populated States of our Eastern border. We are now able to produce almost all the necessary articles of daily consumption, and at a cost inside of that required for laying them down here from the Eastern States. The yoke of dependence upon foreign manufacturers no longer galls,—we shall soon become quite free from the system which formerly obtained of making our wants subservient only to the gain of the importer. Already has our commerce reversed the history of the past;—for we are now "carrying coals to Newcastle," in supplying the Eastern market with breadstuffs. Honest industry has built for itself a well-earned reputation on these shores which can never be shaken by revulsion, or influenced, to any disastrous extent, by a plethora in any class of our productions. In no part of the world is labor so well rewarded as here, and the demand therefore grows healthier year by year. Our field of industry is an ample one, and will never fail, so long as talent, enterprise, industry and capital are present to embrace and realize it.

For manufacturing industries the State of California possesses most marked and manifold advantages. We have never been more forcibly struck with these advantages than while reading a few of the advance sheets of the "Material Wealth of California," by H. V. Cronise, the work which we noticed at considerable length in our issue of April 11th. Foremost among the advantages, as there passed in review, is the vast and widely diffused water-power found in the hill and mountain districts throughout all the northern and eastern sections of the State. The amount of power that may be utilized by a full and economical appropriation of these advantages would, to one unacquainted with their nature and extent, seem almost incredible. It is scarcely equalled by all the water-power of the New England and Middle States combined. The future location of manufactories, foundries and machine shops throughout this district, will be but bringing them to the very doors of the consumers, who will yet be numbered by millions throughout our mining districts, and our fertile hillsides, valleys and plains. The construction of short and cheap railroads, as feeders to our main lines, will place almost every quarter section of this vast region,—producing mineral, building materials, wines and agricultural productions of every description,—in direct and easy steam communication with the seaboard and a market, and thereby blend all these varied interests into one magnificent whole, by which they will "grow up in harmony, mutually depending upon and aiding one another." The influence of this vast and varied net-work of industries upon the larger towns of the State, and particularly upon San Francisco and its suburbs, can scarcely be estimated.

There is another view of the advantages which this State possesses over almost, if not every, other country as yet opened up to manufacturing industries, which, though important, is seldom taken into consideration. It is alluded to in the unpublished pages before us as follows:

"California enjoys in her genial and salubrious climate another great advantage over most manufacturing countries. In that part of the State where these multifarious industries are likely to grow up, it can almost be said that there is no winter. The heat of the summer in the interior is long continued, and in many localities for a time oppressive, though never debilitating, owing to the cool nights that prevail throughout that season. During the remainder of the year the weather there is for the most part delightful,—out-door laborers seldom suffering from either heat or cold. In California the mill-wheel is rarely ever

pinioned by frost, or the paths that lead to the workshops and factories obstructed by snow and ice. Neither is the craftsman ever forced to go shivering to his task, or labor in a chilled and freezing atmosphere—the benignant climate invigorating the system and relieving toil of its greatest hardships. Here the shops and factories do not require to be kept constantly closed to economize the heat within, compelling the operative to labor in a foul, fetid and debilitating atmosphere, destructive to health and depressing to the spirits. Except in the more elevated districts, the temperature is such that even in winter all active employments may be comfortably pursued in the outer air with open doors. In this mildness of the climate the artisan classes will ever find a safeguard against sickness and discomfort, while it reduces materially the cost of living, in the saving of fuel, clothing and shelter. The quantity of fuel required for a small family does not amount to more than half as much in California, take the year through, as is necessary anywhere throughout the Northern and Middle States of the Union; while the cost of clothing, notwithstanding somewhat higher prices, is considerably less than in the Eastern States; the difference in the expense of constructing dwellings being still greater in favor of California. It is estimated by competent judges that at least twenty per cent. more service is rendered the employer here than in most other countries, in consequence of the greater mildness and salubrity of the climate."

The value of the various articles manufactured in San Francisco, during the year 1866, is estimated in the above work at \$20,000,000; while the aggregate value of the manufactures of the entire State are set down at \$30,000,000. To describe, in detail, the progress which has already been made in founding and building up manufacturing interests in this State, would require the compass of an extensive volume; we can here merely allude by name to some of the leading branches which have attained success, as follows: woolen and cotton goods of all kinds, machinery and steam engines, brass work, hemp and wire rope, leather, powder, fuse, paper, glass, salt, soap, candles, chemicals, matches, oil, lime and cement, lead-pipe, sheet lead and shot, marble-work, pottery, boots and shoes, saddles, harness and trunks, wagons, carriages, cars, agricultural implements, furniture, pianos, barrels (by machinery and hand), brooms, wooden-ware, type, cigars, clothing, furs, dried fruits and vegetables, silk, wines, brandies, etc.

It is to the introduction of these branches of manufacture, and to our recent extensive production of breadstuffs, that we are indebted for the new impetus which has recently been given to business of all kinds in this State. By the inauguration of this policy our State has been saved from what might otherwise have been an almost fatal financial prostration. Our future success still depends upon this commingling of industrial pursuits. Without it all the millions of gold and silver which we can dig from our mountains, will be required to pay for machinery, clothing and provisions from abroad. By the introduction of these industries, we are constantly creating new demands for a long catalogue of articles of necessity and luxury. In supplying them we shall continually find foreign outlets for the products of our shops and factories, until the larger part of our bullion products will be required at home to be distributed among our own people, while the product of their manufacturing industries alone will be nearly sufficient to pay our foreign bills. It is by such a policy, and by such only, that we can build up on this coast the empire which may be ours, if we will rightly employ the advantages which nature has so abundantly laid at our doors.

FRENCH ARCTIC EXPLORATION.—An expedition will leave France during the present season for the Arctic ocean. It will be under the management of M. Gustave Lambert, who returned last year from that region via Behrings Straits. It will make an attempt to reach the open Polar Sea, the existence of which has been already determined by Dr. Hayes.

The California Fuse Factory.

We have already made mention of the contemplated establishment of a fuse factory, in this city, for the home and ready supply of all blasting operations. This establishment was first started about ten weeks since, on a somewhat limited scale, at a point near the glass works on the Potrero. The success which has attended them thus far, and the decided preference manifested by all who have used California manufactured fuse, has encouraged the proprietors to greatly enlarge their works; a step which has indeed become necessary in order to meet the increasing demands for their manufacture.

We took occasion, a few days since, to visit the establishment, where we found the machinery in full operation, and preparations being made for the proposed enlargement of the works. The manufacture of blasting fuse is a most interesting operation, and, in order to produce a good and reliable article, the utmost care and attention is required. The company is composed entirely of practical men, who are, with one exception, miners, and fully understand what is wanted, having often experienced the disadvantage of being compelled to use an inferior article, at great cost and loss of time. Messrs. Eva and Powning, the two principal proprietors, and the projectors of the enterprise, give the work their undivided personal attention, as it is their determination to furnish a home product at a price and of a quality which shall remove any occasion for sending abroad for this important article.

The importance of having fuse freshly made, and direct from the manufactory, is well understood by those whose lives are often endangered by working with a defective article. Much difficulty is encountered in the use of imported fuse from its deterioration in transportation. In passing through hot climates, as it must, to reach California, the tar or other material with which it is covered, is liable to penetrate to the powder, and destroy the continuity of the conducting medium of the fuse, thereby causing frequent failures in blasts, and greatly delaying operations generally, besides endangering the lives of those engaged in such work.

It is also found necessary, in many of our deep mining operations, to employ fuse of unusual lengths—longer than any which is imported. This establishment is prepared to furnish such extra lengths to any extent which may be required, and for any special purpose.

The factory at the present time has a capacity for the manufacture of from 12,000 to 15,000 feet per day, which will be increased from time to time to meet the demands of the market.

NORTH AMERICA Life Insurance Company.

A GREAT PUBLIC GOOD!

City Land Association!

ON THE MUTUAL PLAN.

Incorporated under the Laws of the State of California.

WE HAVE OPENED BOOKS OF SUBSCRIPTION FOR well located lots, of twenty-five feet front by one hundred feet in depth, at ninety dollars per lot, in payment of four dollars per month, without interest or any other assessments. The property is situated on the southern part of the San Miguel Rancho (U. S. Patent), and has a fine frontage on the San Jose Railroad. It is but a short distance from the Mission, and streets are laid out to the very boundary of the tract, which is in the direct line of city improvements. Every lot is suitable, at once, for building purposes, and can be subdivided with the Spring Valley Water. The San Miguel Rancho title is perfect and reliable. By a number of subscribers joining together to the purchase of this property, the lots can be offered for the terms proposed, that is, at ninety dollars each, in payments of four dollars per month, without interest—giving the Association the benefit of the mutual principle, as incorporated in insurance and other companies. The streets and blocks have been laid out by Mr. W. P. Humphreys, the City Surveyor. The streets are all eleven feet wider than either Washington or Clay streets, and the main avenue on the railroad is the width of Market street. There are no small streets.

This plan has been projected for the purpose of aiding all who may wish to benefit by it in obtaining lots at a very low rate, and thus giving to each an opportunity to share in the profits of home-built lots.

The officers of this Association are reliable business men, and one of our principal banks will be the Treasurer of its funds.

Having been appointed Agents until the organization is completed, we are ready to give to our friends and the public all the information on the subject that an experience of eighteen years in real estate in San Francisco qualifies us to render them.

The Books of Subscription are now open. Large Maps of the property of the Association will be furnished to subscribers within a week. Our subscription is open every evening, until 9 o'clock.

DUNN & CO.,
Agents for the City Land Association,
17v16-1t 427 Montgomery street.

Support Home Manufactures.

California Pioneer Fuse

MANUFACTURING COMPANY,

MANUFACTURERS OF

HOSE AND TAPE FUSE,

A New and Superior Article for Blasting in very wet ground, or under water.

Great difficulty has heretofore been experienced by miners, and others in the use of Fuse, which has been subjected to deterioration from exposure to dampness during transportation, or during the great length of time which has passed between its manufacture and use. In addition to great painstaking in the manufacture of the California-made Fuse, the above and many similar objections are entirely obviated, and the operator can always depend with certainty upon the burning of his fuse.

It is often the case that extra lengths are required, as exploding tunnels, etc., longer than is furnished in the imported article. Fuse of every desired length or size can be made to especial order, at the above manufactory.

Manufactory, . . . Potrero, San Francisco.

KNICKERBOCKER

Life Insurance Company,

OF NEW YORK.

Assets, - - over \$3,000,000.

Number of Policies Issued in 1867, 10,300.

Amount Insured, - - \$31,375,071 00.

POLICIES ISSUED AT ONCE,

On receipt of Application at the San Francisco Branch Office, without referring to the Home Office at New York.

Policies Paid in Gold Coin or Greenbacks,
at the option of the person insuring.

[Extract from report of the Home Office, for Dec. 1867.]
"The Company's history for the past fifteen years shows favorably, and it standing to-day ranks it among first class Societies. It has carried out in good faith every contract made by it, never contesting a Southern claim during the war, while it is well known that many of our largest companies repudiated their Southern risks at the commencement of our National struggle, thereby increasing their assets. This honorable dealing of the Knickerbocker in the past, is a pledge of its future good faith."
